

Contents

1 Geometric and kinematic foundations of Lagrangian mechanics	1
1.1 Curves in the plane	1
1.2 Length of a curve and natural parametrisation	3
1.3 Tangent vector, normal vector and curvature of plane curves	7
1.4 Curves in \mathbf{R}^3	12
1.5 Vector fields and integral curves	15
1.6 Surfaces	16
1.7 Differentiable Riemannian manifolds	33
1.8 Actions of groups and tori	46
1.9 Constrained systems and Lagrangian coordinates	49
1.10 Holonomic systems	52
1.11 Phase space	54
1.12 Accelerations of a holonomic system	57
1.13 Problems	58
1.14 Additional remarks and bibliographical notes	61
1.15 Additional solved problems	62
2 Dynamics: general laws and the dynamics of a point particle	69
2.1 Revision and comments on the axioms of classical mechanics	69
2.2 The Galilean relativity principle and interaction forces	71
2.3 Work and conservative fields	75
2.4 The dynamics of a point constrained by smooth holonomic constraints	77
2.5 Constraints with friction	80
2.6 Point particle subject to unilateral constraints	81
2.7 Additional remarks and bibliographical notes	83
2.8 Additional solved problems	83
3 One-dimensional motion	91
3.1 Introduction	91
3.2 Analysis of motion due to a positional force	92
3.3 The simple pendulum	96
3.4 Phase plane and equilibrium	98
3.5 Damped oscillations, forced oscillations. Resonance	103
3.6 Beats	107
3.7 Problems	108
3.8 Additional remarks and bibliographical notes	112
3.9 Additional solved problems	113

4	The dynamics of holonomic systems. Lagrangian formalism	125
4.1	Cardinal equations	125
4.2	Holonomic systems with smooth constraints	127
4.3	Lagrange's equations	128
4.4	Determination of constraint reactions. Constraints with friction	136
4.5	Conservative systems. Lagrangian function	138
4.6	The equilibrium of holonomic systems with smooth constraints	141
4.7	Generalised potentials. Lagrangian of an electric charge in an electromagnetic field	142
4.8	Motion of a charge in a constant electric or magnetic field	144
4.9	Symmetries and conservation laws. Noether's theorem	147
4.10	Equilibrium, stability and small oscillations	150
4.11	Lyapunov functions	159
4.12	Problems	162
4.13	Additional remarks and bibliographical notes	165
4.14	Additional solved problems	165
5	Motion in a central field	179
5.1	Orbits in a central field	179
5.2	Kepler's problem	185
5.3	Potentials admitting closed orbits	187
5.4	Kepler's equation	193
5.5	The Lagrange formula	197
5.6	The two-body problem	200
5.7	The n -body problem	201
5.8	Problems	205
5.9	Additional remarks and bibliographical notes	207
5.10	Additional solved problems	208
6	Rigid bodies: geometry and kinematics	213
6.1	Geometric properties. The Euler angles	213
6.2	The kinematics of rigid bodies. The fundamental formula	216
6.3	Instantaneous axis of motion	219
6.4	Phase space of precessions	221
6.5	Relative kinematics	223
6.6	Relative dynamics	226
6.7	Ruled surfaces in a rigid motion	228
6.8	Problems	230
6.9	Additional solved problems	231
7	The mechanics of rigid bodies: dynamics	235
7.1	Preliminaries: the geometry of masses	235
7.2	Ellipsoid and principal axes of inertia	236

7.3	Homography of inertia	239
7.4	Relevant quantities in the dynamics of rigid bodies	242
7.5	Dynamics of free systems	244
7.6	The dynamics of constrained rigid bodies	245
7.7	The Euler equations for precessions	250
7.8	Precessions by inertia	251
7.9	Permanent rotations	254
7.10	Integration of Euler equations	256
7.11	Gyroscopic precessions	259
7.12	Precessions of a heavy gyroscope (spinning top)	261
7.13	Rotations	263
7.14	Problems	265
7.15	Additional solved problems	266
8	Analytical mechanics: Hamiltonian formalism	279
8.1	Legendre transformations	279
8.2	The Hamiltonian	282
8.3	Hamilton's equations	284
8.4	Liouville's theorem	285
8.5	Poincaré recursion theorem	287
8.6	Problems	288
8.7	Additional remarks and bibliographical notes	291
8.8	Additional solved problems	291
9	Analytical mechanics: variational principles	301
9.1	Introduction to the variational problems of mechanics	301
9.2	The Euler equations for stationary functionals	302
9.3	Hamilton's variational principle: Lagrangian form	312
9.4	Hamilton's variational principle: Hamiltonian form	314
9.5	Principle of the stationary action	316
9.6	The Jacobi metric	318
9.7	Problems	323
9.8	Additional remarks and bibliographical notes	324
9.9	Additional solved problems	324
10	Analytical mechanics: canonical formalism	331
10.1	Symplectic structure of the Hamiltonian phase space	331
10.2	Canonical and completely canonical transformations	340
10.3	The Poincaré–Cartan integral invariant. The Lie condition	352
10.4	Generating functions	364
10.5	Poisson brackets	371
10.6	Lie derivatives and commutators	374
10.7	Symplectic rectification	380

10.8	Infinitesimal and near-to-identity canonical transformations. Lie series	384
10.9	Symmetries and first integrals	393
10.10	Integral invariants	395
10.11	Symplectic manifolds and Hamiltonian dynamical systems	397
10.12	Problems	399
10.13	Additional remarks and bibliographical notes	404
10.14	Additional solved problems	405
11	Analytic mechanics: Hamilton–Jacobi theory and integrability	413
11.1	The Hamilton–Jacobi equation	413
11.2	Separation of variables for the Hamilton–Jacobi equation	421
11.3	Integrable systems with one degree of freedom: action-angle variables	431
11.4	Integrability by quadratures. Liouville’s theorem	439
11.5	Invariant l -dimensional tori. The theorem of Arnol’d	446
11.6	Integrable systems with several degrees of freedom: action-angle variables	453
11.7	Quasi-periodic motions and functions	458
11.8	Action-angle variables for the Kepler problem. Canonical elements, Delaunay and Poincaré variables	466
11.9	Wave interpretation of mechanics	471
11.10	Problems	477
11.11	Additional remarks and bibliographical notes	480
11.12	Additional solved problems	481
12	Analytical mechanics: canonical perturbation theory	487
12.1	Introduction to canonical perturbation theory	487
12.2	Time periodic perturbations of one-dimensional uniform motions	499
12.3	The equation $D_\omega u = v$. Conclusion of the previous analysis	502
12.4	Discussion of the fundamental equation of canonical perturbation theory. Theorem of Poincaré on the non-existence of first integrals of the motion	507
12.5	Birkhoff series: perturbations of harmonic oscillators	516
12.6	The Kolmogorov–Arnol’d–Moser theorem	522
12.7	Adiabatic invariants	529
12.8	Problems	532

12.9	Additional remarks and bibliographical notes	534
12.10	Additional solved problems	535
13	Analytical mechanics: an introduction to ergodic theory and to chaotic motion	545
13.1	The concept of measure	545
13.2	Measurable functions. Integrability	548
13.3	Measurable dynamical systems	550
13.4	Ergodicity and frequency of visits	554
13.5	Mixing	563
13.6	Entropy	565
13.7	Computation of the entropy. Bernoulli schemes. Isomorphism of dynamical systems	571
13.8	Dispersive billiards	575
13.9	Characteristic exponents of Lyapunov. The theorem of Oseledec	578
13.10	Characteristic exponents and entropy	581
13.11	Chaotic behaviour of the orbits of planets in the Solar System	582
13.12	Problems	584
13.13	Additional solved problems	586
13.14	Additional remarks and bibliographical notes	590
14	Statistical mechanics: kinetic theory	591
14.1	Distribution functions	591
14.2	The Boltzmann equation	592
14.3	The hard spheres model	596
14.4	The Maxwell–Boltzmann distribution	599
14.5	Absolute pressure and absolute temperature in an ideal monatomic gas	601
14.6	Mean free path	604
14.7	The ‘H theorem’ of Boltzmann. Entropy	605
14.8	Problems	609
14.9	Additional solved problems	610
14.10	Additional remarks and bibliographical notes	611
15	Statistical mechanics: Gibbs sets	613
15.1	The concept of a statistical set	613
15.2	The ergodic hypothesis: averages and measurements of observable quantities	616
15.3	Fluctuations around the average	620
15.4	The ergodic problem and the existence of first integrals	621
15.5	Closed isolated systems (prescribed energy). Microcanonical set	624

15.6	Maxwell–Boltzmann distribution and fluctuations in the microcanonical set	627
15.7	Gibbs' paradox	631
15.8	Equipartition of the energy (prescribed total energy)	634
15.9	Closed systems with prescribed temperature. Canonical set	636
15.10	Equipartition of the energy (prescribed temperature)	640
15.11	Helmholtz free energy and orthodicity of the canonical set	645
15.12	Canonical set and energy fluctuations	646
15.13	Open systems with fixed temperature. Grand canonical set	647
15.14	Thermodynamical limit. Fluctuations in the grand canonical set	651
15.15	Phase transitions	654
15.16	Problems	656
15.17	Additional remarks and bibliographical notes	659
15.18	Additional solved problems	662
16	Lagrangian formalism in continuum mechanics	671
16.1	Brief summary of the fundamental laws of continuum mechanics	671
16.2	The passage from the discrete to the continuous model. The Lagrangian function	676
16.3	Lagrangian formulation of continuum mechanics	678
16.4	Applications of the Lagrangian formalism to continuum mechanics	680
16.5	Hamiltonian formalism	684
16.6	The equilibrium of continua as a variational problem. Suspended cables	685
16.7	Problems	690
16.8	Additional solved problems	691
 Appendices		
	Appendix 1: Some basic results on ordinary differential equations	695
	A1.1 General results	695
	A1.2 Systems of equations with constant coefficients	697
	A1.3 Dynamical systems on manifolds	701
	Appendix 2: Elliptic integrals and elliptic functions	705
	Appendix 3: Second fundamental form of a surface	709
	Appendix 4: Algebraic forms, differential forms, tensors	715
	A4.1 Algebraic forms	715
	A4.2 Differential forms	719
	A4.3 Stokes' theorem	724
	A4.4 Tensors	726

Appendix 5: Physical realisation of constraints	729
Appendix 6: Kepler's problem, linear oscillators and geodesic flows	733
Appendix 7: Fourier series expansions	741
Appendix 8: Moments of the Gaussian distribution and the Euler Γ function	745
Bibliography	749
Index	759
