Foreword xii
Prologue xiv

1 Documenting the breadth and depth of the problem 1
Newcomers, beware: brace yourselves 'cause this ain't gonna be easy! 3
How bad is the situation, really? 4
The head-in-the-sand approach: choosing a measure without providing a rationale 7
The dreadful but all too common "this measure was used because it has been used before" 11
"They're all the same": interchanging terms referring to substantively different constructs 13
Measures as sacrosanct legacies: sticking with a measure no matter what 16
Internal consistency as the summary index of psychometric merit 17
Armed with easy to use software but no theory: confirmatory factor analysis misapplied 18
Domain specificity as panacea 27
Conclusion 31

2 Untangling the terminological Gordian knot 33
The differences between affect, emotion, and mood 33
Recognizing the pitfalls of imprecise and inconsistent terminology 36
What is *core affect*? 38
What is *emotion*? 40
What is *mood*? 43
What does this mean and why should we care? 46
Conclusion 51

3 Should affective states be considered as distinct entities or as positioned along dimensions? 52
Distinct entities or dimensions: why should we care? 53
The distinct-states approach 55

The dimensional approach 56
Russell's circumplex model 57
Watson and Tellegen's Positive Affect – Negative Affect model 58
Thayer's two-dimensional model 62
The integrative circumplex of Larsen and Diener 64
The compatibility of contemporary dimensional models 65
The hierarchical structure of the affective domain: an integrative framework 67
Conclusion 72

4 Are pleasant and unpleasant states independent or polar opposites? 76
Questions of bipolarity versus independence: what complexities lurk beneath the surface? 76
The crucial role of methodological factors 79
Evaluative Space Model and "emotionally complex" situations 82
Neural considerations 85
Current status of the bipolarity versus independence debate 89
What does this all mean and why should we care? 91

5 Selecting a measure: a proposed three-step process 96
Justifying the selection of a measure: some examples 99

6 The old classics: measures of distinct states 102
The Multiple Affect Adjective Check List 102
The Profile of Mood States 104
The State-Trait Anxiety Inventory 111

7 Dimensional measures 121
The Self-Assessment Manikin 121
The Affect Grid 124
The Circular Mood Scale 125
The Feeling Scale and the Felt Arousal Scale 126
The Evaluative Space Grid 128
The Semantic Differential Measures of Emotional State 129
The Positive and Negative Affect Schedule 130
The Activation Deactivation Adjective Check List 133

8 Domain-specific measurement: challenges and solutions 138
Lack of theoretical basis 139
Domain underrepresentation 142
The troubled notion of domain specificity 144
The "sensitivity" slippery slope 147
If not domain specificity, then what? 148

9 Problems of domain specificity: examples from exercise 155
The Exercise-induced Feeling Inventory 155
The Subjective Exercise Experiences Scale 159
The Physical Activity Affect Scale 162

Epilogue 168
