1	Introduction	9
2	Experimental setup	11
2.1	Introduction	11
2.2	GSI accelerator complex	12
2.3	FRS fragment separator	14
2.4	FRS detectors	16
2.4.1	Scintillators	16
2.4.2	Time projection chambers (TPCs)	16
2.4.3	Multiwire proportional counters (MWs)	19
2.4.4	Multi-sampling ionization chambers (MUSICs)	19
2.5	Active stopper	19
2.6	RISING germanium array	20
2.6.1	γ ray detection with high-purity germanium (HPGe) detectors	20
2.6.2	Analysis of HPGe data	24
2.6.3	RISING	26
2.7	Data acquistion and trigger system	28
3	Data analysis	31
3.1	Software: R2D2	31
3.1.1	Introduction	31
3.1.2	Organisation	31
3.1.3	Unpacker	33
3.1.4	Calibration	33
3.1.5	Particle identification	35
3.1.6	Germanium add-back	36
3.1.7	Implantation/decay correlation	36
3.2	Software: HDTV	40
3.3	Calibration of the RISING array	41
3.3.1	Calibration sources	41
3.3.2	Automatic calibration	42
3.3.3	Technical challenges: the power supply problem	43

3.4	Calibration of the active stopper	48
3.4.1	Direct calibration	48
3.4.2	Compton scattering calibration	50
3.5	Transition probabilities	51
3.6	Halflife determination	54
4	Experimental results	57
4.1	Particle identification	57
4.2	^{98}Cd	57
4.2.1	γ transitions	57
4.2.2	Transition at 4158 keV	59
4.2.3	Intensity balance	63
4.3	^{98}Ag	66
4.3.1	γ transitions	66
4.3.2	Lifetime of the 60.6 keV and 107 keV transitions	67
4.3.3	Implantation of ^{98}Ag	71
5	Discussion of results	73
5.1	Theoretical description of atomic nuclei	73
5.2	The nuclear shell model	74
5.2.1	Shell structure of atomic nuclei	75
5.2.2	Surface delta interaction	78
5.3	Shell model calculations for ^{98}Cd	81
5.4	Shell model calculations for ^{98}Ag	86
6	Conclusion	87
