FOREWORD	xxi
INTRODUCTION	xxiii
1. UNITS AND PHYSICAL CONSTANTS	
<i>Frederick D. Rossini</i>	
Basic units of measurements	1-1
Scale of temperature	1-2
Scale of atomic weights	1-6
Unit of energy	1-8
Physical constants	1-9
References	1-12
2. BASIC PRINCIPLES OF COMBUSTION CALORIMETRY	
<i>Stig Sunner</i>	
Introduction	2-1
The calorimeter	2-1
Adiabatic calorimeters	2-2
Phase-change calorimeters	2-2
Temperature-following shield calorimeters	2-3
Isoperibol calorimeters	2-4
Heat-flow calorimeters	2-4
The calorimetric experiment	2-5
Standard-state energies of combustion	2-8
The adiabatic temperature rise	2-9
The heat-exchange equation	2-10
Radiation	2-11
Convection	2-12
Conduction	2-13
Calculation of the correction for heat exchange	2-15
The final temperature of an experiment	2-19
Comments on the measurement and control of temperature	2-19
References	2-21

3.	CALIBRATION OF COMBUSTION CALORIMETERS	
	<i>Cornelis Mosselman and Kenneth L. Churney</i>	
	Theory and design criteria	3-1
	Calculation of the adiabatic temperature rise	3-9
	Isoperibol calorimetry	3-9
	Other types of calorimetry	3-13
	Calibration with certified reference materials	3-13
	Electrical calibration	3-15
	References	3-19
4.	TEST AND AUXILIARY SUBSTANCES IN COMBUSTION CALORIMETRY	
	<i>John D. Cox</i>	
	Introduction	4-1
	The role of test substances	4-2
	The role of auxiliary substances	4-3
	Characteristics of test and auxiliary substances	4-3
	Desirable properties for test substances	4-3
	Desirable properties for auxiliary substances	4-5
	Selected test and auxiliary substances	4-5
	"Recommended" and "candidate" test substances	4-5
	Sources of recommended values in tables 1 and 2	4-6
	Typical auxiliary substances	4-18
	Needs for further test substances	4-19
	References	4-20
5.	STRATEGIES IN THE CALCULATION OF STANDARD-STATE ENERGIES OF COMBUSTION FROM THE EXPERIMENTALLY DETERMINED QUANTITIES	
	<i>Margret Månsson and Ward N. Hubbard</i>	
	Introduction	5-1
	Principles and general considerations	5-3
	General scheme	5-3
	Processes involved	5-3
	Significance of terms under varying conditions	5-4
	Absolute versus differential terms	5-4
	Comparison experiments	5-5
	Auxiliary quantities and uncertainties	5-5
	Strategies in setting up a reduction scheme	5-6
	Combustion of a solid to a solid product	5-6
	Flow chart - choice of path	5-7
	Magnitude of terms	5-10
	Outline of bookkeeping	5-11
	Combustion of a solid to a gaseous product	5-11
	Combustions with two-phase reactant or product	5-13
	Combustions with a bomb liquid present	5-14
	Thermodynamic states	5-19
	Standard states	5-19
	Reference states	5-20
	Bomb states	5-22
	Reactions other than the main combustion reaction	5-24
	Auxiliary materials	5-24

Impurities and products from incomplete combustion	5-24
Auxiliary reactions	5-26
Side reactions	5-27
Blank experiments	5-27
Calibrations	5-28
Calibration with certified reference materials under non-certification conditions	5-28
Comparison experiments	5-29
Test substances and test reactions	5-31
Bookkeeping	5-31
Equilibrium between and within phases	5-31
Specification of the bomb systems	5-32
Volume and amount of gas	5-32
Stoichiometry of the overall bomb process	5-33
Interdependent equilibria	5-33
Single-phase equilibria - condensed phase	5-34
Effect of pressure on activity	5-34
Influence from other solutes on activity	5-34
Single-phase equilibria - gaseous phase	5-36
Two-phase equilibria	5-37
Effect of pressure on equilibrium vapour pressures	5-37
Effect of solutes on the vapour pressure of the solvent	5-37
Vapour pressure of water in compressed gases	5-38
Solution of gas in bomb liquids	5-40
Reduction processes	5-43
Choice of path	5-43
Constant volume and constant pressure processes	5-43
Compression and decompression processes	5-44
Mixing and unmixing processes	5-45
Dilution and concentration processes	5-45
Dissociation (ionization) and association processes	5-47
Vaporization and condensation processes	5-47
Solution and desolution processes	5-47
Adsorption and desorption processes	5-49
Computer programs	5-49
Presentation of results	5-50
Appendix: Auxiliary quantities for the reductions to standard states	5-51
References	5-55
Washburn reduction schemes in the literature	5-55
General references	5-56

6. ASSIGNMENT OF UNCERTAINTIES

Gerd Olofsson

Introduction	6-1
Random errors	6-1
Precision of the experimental process	6-1
Check of precision	6-3
Check on outlying observations	6-5
Properties of the mean	6-8
The precision of the mean	6-8

The distribution of the sample mean	6-9
Confidence interval for the population mean	6-9
Comparison of means	6-9
The weighted mean	6-12
Propagation of errors	6-13
Random errors	6-13
Systematic errors	6-14
The uncertainty interval and the expression of uncertainties of results	6-15
An example of assignment of overall random uncertainty to a value of ΔH_f°	6-17
Replication uncertainty in the specific standard energy of combustion	6-18
The total experimental random uncertainty	6-20
The overall random uncertainty	6-20
The standard enthalpy of formation	6-21
Symbols used on pages 6-17 through 6-22	6-22
References	6-23
Appendix: COMMENTS FROM A COMPILER	6-24
<i>Vadim A. Medvedev</i>	
7. PRESENTATION OF COMBUSTION CALORIMETRIC DATA IN THE PRIMARY LITERATURE	
<i>Edgar F. Westrum, Jr.</i>	
Historical perspective	7-1
Introduction	7-2
Description of experimental procedure	7-3
Definition of the system studied	7-3
Materials	7-3
Apparatus and procedures	7-3
Performance of the calorimetric system	7-4
Reduction of experimental results	7-4
Presentation of numerical results	7-4
Derived quantities	7-6
Assignment of uncertainties	7-6
Symbols, units, and nomenclature	7-6
Discussion	7-6
References	7-7
8. GENERAL TECHNIQUES FOR COMBUSTION OF LIQUID/SOLID ORGANIC COMPOUNDS BY OXYGEN BOMB CALORIMETRY	
<i>Arthur J. Head, William D. Good, and Cornelis Mosselman</i>	
The sample	8-1
Measurement of purity	8-1
Preparation for combustion	8-2
Handling non-volatile, non-hygroscopic substances stable in oxygen	8-2
Handling volatile, hygroscopic or oxygen-reactive substances	8-3
Physical state	8-5

CONTENTS

ix

Mass	8-5
Problems of static charge	8-5
Buoyancy corrections	8-5
The combustion process	8-5
The bomb and its fittings	8-5
Addition of other reagents to the bomb	8-8
Oxygen	8-9
Ignition	8-10
Calorimetry	8-11
Analysis of products	8-12
Examination for soot, carbon monoxide, and unburnt substance	8-12
Determination of carbon dioxide	8-13
Determination of oxides and oxyacids of nitrogen	8-14
References	8-14
9. COMBUSTION OF LIQUID/SOLID ORGANIC COMPOUNDS WITH NON-METALLIC HETERO-ATOMS	
<i>Arthur J. Head and William D. Good</i>	
Introduction	9-1
Compounds containing nitrogen	9-3
Compounds containing sulphur	9-4
Compounds containing fluorine	9-5
Compounds containing chlorine	9-7
Compounds containing bromine	9-10
Compounds containing iodine	9-11
Compounds containing boron	9-12
Compounds containing silicon	9-14
Compounds containing phosphorus	9-16
Compounds containing arsenic	9-17
Compounds containing selenium	9-18
References	9-19
10. COMBUSTION CALORIMETRY OF METALS AND SIMPLE METALLIC COMPOUNDS	
<i>Charles E. Holley, Jr. and Elmer J. Huber, Jr.</i>	
Introduction	10-1
Calorimetric considerations	10-2
Chemical considerations	10-3
The sample	10-3
The oxygen	10-4
Ignition	10-5
The container	10-6
Getting the right reaction	10-7
Determining the amount of reaction	10-7
Side reactions	10-8
The thermodynamic state of the reactants and the products	10-9
Calculations	10-9
Metals whose energies of combustion have been measured	10-9
Group I	10-9

Group II	10-13
Group III	10-13
Group IV	10-13
Group V	10-14
Group VI	10-14
Group VII	10-14
Group VIII	10-14
Some metallic compounds whose energies of combustion have been measured	10-14
Oxides	10-14
Carbides	10-16
Nitrides	10-16
Comparison of results: oxygen bomb calorimetry and fluorine bomb calorimetry	10-20
References	10-23
11. COMBUSTION CALORIMETRY OF ORGANOMETALLIC COMPOUNDS	
<i>Henry A. Skinner</i>	
Introduction	11-1
Static bomb combustion studies	11-1
Alkali metals (IA)	11-2
Copper, silver, and gold (IB)	11-2
Zinc, cadmium, and mercury (IIB)	11-2
Aluminium, scandium, yttrium and the lanthanides (IIIA)	11-3
Gallium, indium and thallium (IIIB)	11-4
Titanium, zirconium, and hafnium (IVA)	11-4
Germanium, tin, and lead (IVB)	11-5
Vanadium, niobium, and tantalum (VA)	11-6
Antimony and bismuth (VB)	11-6
Chromium, molybdenum, and tungsten (VIA)	11-6
Manganese and rhenium (VIIA)	11-7
Iron, cobalt, and nickel (VIII)	11-8
Rotating bomb combustion studies	11-8
Alkyl- and aryl-lead compounds	11-8
Dimanganese decacarbonyl	11-8
Alkyl- and aryl-germanium compounds	11-9
Bis(dithio-acetylacetonato) cobalt(II) and nickel(II)	11-9
General assessment of bomb combustion methods	11-9
The strengths of metal-carbon bonds	11-11
References	11-13
12. COMBUSTION IN FLUORINE AND OTHER HALOGENS	
<i>Ward N. Hubbard, Gerald K. Johnson, and Vladimir Ya. Leonidov</i>	
Introduction	12-1
General problems	12-2
Safety	12-3
Fluorine	12-4
Materials of construction and passivation of apparatus	12-6

The calorimeter and its calibration	12-7
Reaction vessels	12-8
One-compartment bombs	12-8
Two-compartment reaction vessels	12-11
Glass reaction vessels	12-11
Two-compartment bombs	12-12
Bombs with sealed crucibles	12-16
Auxiliary apparatus	12-17
Bomb charging and discharging manifolds	12-17
Exploratory reaction vessels	12-17
Gloveboxes	12-18
Experimental techniques	12-18
Ignition of sample and combustion aids	12-18
Sample arrangements and associated problems	12-20
Analyses	12-21
Test substances	12-22
Correction to standard-state conditions	12-23
Discussion	12-25
References	12-31
13. BOMB COMBUSTION OF GASEOUS COMPOUNDS IN OXYGEN	
<i>Victor P. Kolesov</i>	
Introduction	13-1
Principal features of the bomb method	13-2
Calorimetric equipment and technique	13-3
Chemistry of the combustion reaction	13-5
Thermodynamic states and appropriate thermal corrections	13-10
Intercomparison of results	13-12
Conclusion	13-14
References	13-14
14. OXYGEN FLAME CALORIMETRY	
<i>Geoffrey Pilcher</i>	
Introduction	14-1
Apparatus	14-2
The burner vessel	14-2
Ignition system	14-3
Calorimeter assembly	14-3
Inlet-gas purification lines	14-4
Purity test for gases	14-5
Sample inlet system	14-5
Analysis of the products	14-6
Analysis of water	14-7
Analysis of carbon dioxide	14-8
Absorption tubes	14-8
Calibration	14-9
Calibration with electrical energy	14-9
Calibration by combustion of hydrogen in oxygen	14-9
Calculation of the energy equivalent	14-10
Enthalpies of combustion of CH and CHO compounds	14-11
Procedure for combustion experiments	14-12

Ignition energy	14-12
Amount of reaction and completeness of combustion	14-13
Calculation of the standard enthalpy of combustion	14-13
Enthalpies of combustion of compounds containing nitrogen	14-15
Enthalpies of combustion of compounds containing chlorine	14-16
The combustion-reaction vessel	14-16
Chemical procedure and analysis of products	14-18
Calculation of the standard enthalpy of combustion	14-19
Summary of results obtained by flame calorimetry	14-20
References	14-24
15. FLUORINE FLAME CALORIMETRY	
<i>George T. Armstrong and Reatha Clark King</i>	
Introduction	15-1
The need for gas-flow calorimetry of fluorine compounds	15-1
Experiment types	15-3
One-phase procedure	15-3
Two-phase procedure	15-3
Special technical problems	15-4
Safe use of fluorine	15-4
Effects of corrosive action	15-5
Materials of construction	15-6
Chemical and thermodynamic description of the process	15-6
Instrumentation	15-8
Calorimeter	15-8
Reaction vessel	15-9
For one-phase reactions	15-9
For two-phase reactions	15-10
Burner design and flame ignition	15-11
Flow systems	15-13
Gas sample containers	15-16
Analysis of fluorine and fluorinaceous oxidizers	15-17
Special calibration problems	15-17
Definition of the calorimeter system	15-17
Calibration by electrical energy	15-18
Calibration by chemical reaction	15-18
Specific applications	15-18
One-phase procedures	15-18
Halogen-hydrogen reactions	15-18
Two-phase procedures	15-19
Halogen-hydrogen-water reactions	15-19
Inter-halogen compounds	15-20
Halogen compounds of oxygen	15-20
Halogen compounds of nitrogen	15-20
Experimental evaluation of reaction enthalpies	15-21
Validity of the corrosion correction	15-22
Assessment of errors	15-24

Perspective on future measurements	15-25
References	15-26
16. COMBUSTION CALORIMETRY AS A TECHNOLOGICAL SERVICE	
<i>Oswald Riedel and Heinz Vogl</i>	
Introduction	16-1
The technological importance of heats of reaction	16-1
The significance of combustion calorimetry in industrial practice	16-2
Calorific values of gases	16-2
Definition of calorific values	16-2
Types of calorimeters	16-3
Practical examples	16-6
Calorific values of solids and liquids	16-7
Definitions of calorific values	16-7
Instrumentation	16-8
Practical examples	16-9
Methods for precision combustion calorimetry	16-10
Practical examples of the use of precision combustion calorimetry	16-10
Cyclodimerization of styrene	16-10
Experimental procedures and results	16-10
Group parameter calculations	16-11
Calculations based on structural similarity considerations	16-13
1,4-Butanediol diacetate by addition of acetic acid to 1,3-butadiene and hydrolysis to 1,4-butanediol and tetrahydrofuran	16-14
A process for producing caprolactam	16-16
Acknowledgment	16-19
References	16-19
17. TRENDS IN COMBUSTION CALORIMETRY	
17:1 ANEROID BOMB COMBUSTION CALORIMETRY	
<i>Alex S. Carson</i>	
Introduction	17-1
Static calorimeters	17-1
Rotating calorimeters	17-3
Aneroid micro calorimeters	17-4
Calorimeter design	17-5
References	17-6
17:2 MINIATURIZATION OF BOMB COMBUSTION CALORIMETRY	
<i>Margret Månsson</i>	
Introduction	17-8
The calorimeter	17-9
The chemistry of the bomb process	17-11
Amount of reaction	17-11
Bomb volume	17-12
Encapsulation techniques	17-12
References	17-13

17:3 THE USE OF THE TIAN-CALVET MICROCALORIMETER FOR COMBUSTION MEASUREMENTS	17-15
<i>Marc Laffitte</i>	
18. FROM THE HISTORY OF COMBUSTION CALORIMETRY	
<i>Eugene S. Domalski</i>	
Introduction	18-1
Contributions by Thomsen	18-2
Contributions by Berthelot	18-5
Contributions by Stohmann	18-8
The evolution of combustion bombs	18-9
Electrical calibration of bomb calorimeters	18-11
Contributions by some prominent calorimetrists, 1910 to 1930	18-12
H.C. Dickinson	18-12
T.W. Richards	18-12
W.A. Roth	18-13
W. Swietosławski	18-13
P.E. Verkade	18-14
Acceptance of benzoic acid as a bomb calorimetric standard	18-15
Contributions by Washburn and Rossini	18-17
E.W. Washburn	18-17
F.D. Rossini	18-17
Novel developments in combustion calorimetry	18-18
Problems with compounds containing sulfur and halogens	18-18
Moving-bomb methods	18-19
Fluorine combustion calorimetry	18-19
Conclusions	18-20
Habitat of some prominent scientists in the history of combustion calorimetry	18-21
References	18-22
Additional references relevant to combustion calorimetry through 1930	18-27
