

CONTENTS

Foreword by Ian Lowe	x
Acknowledgements	xiii
Introduction	xiv
Part A: Basic concepts and scenarios	1
1 Energy and its greenhouse gas emissions	3
Natural flows of energy	4
Human use of energy	5
What are energy and power?	7
Energy is conserved	9
Energy flows 'downhill'	11
Energy production, consumption and associated emissions	13
Balancing electricity demand and supply	16
Enter 'intermittent' renewable energy	22
Ecologically sustainable energy system	23
Conclusion	26
2 Energy resources and technologies	28
Maturity of energy technologies	30
Solar energy	36
Wind energy	45
Bioenergy	46
Hydro-electricity and marine energy	51
Geothermal energy	55
Storage of renewable electricity	56
Conclusion	61
3 Sustainable energy scenarios	63
Overview of scenario studies	64
GHG reduction scenarios: wide scope	66
Electricity scenarios	74
Electricity scenarios: computer simulations	76
Simulations of 100 per cent renewable electricity	78
Myth-busting results and discussion	83

How rapidly can we transition?	90
Conclusion	91
Part B: Which technologies are sustainable?	93
4 Saving energy	95
Energy efficiency: buildings and industry	102
Barriers to energy efficiency	105
Overcoming barriers: strategies and policies	107
Conclusion	114
5 Renewable energy technology impacts	116
Energy payback	117
Water and other materials	121
Other environmental, health and social impacts	122
Quantified costs and unquantified benefits	128
Jobs in sustainable energy	133
Conclusion	136
6 Is nuclear energy a solution?	137
A personal statement	137
Introduction	138
Status of nuclear energy	139
Nuclear energy life-cycle	141
Life-cycle CO ₂ emissions	144
Alternative nuclear technologies	147
Slow deployment	151
High-level radioactive wastes	152
Accidents	153
Proliferation and terrorism	156
Economics	162
Conclusion	170
7 Transport and urban form	172
Impacts of car and truck dependency	174
Integrated urban and transport planning	179
Improved vehicles and fuels	186
Intercity transport	191
Encouraging signs of change	192
Conclusion	193
Part C: Policies, strategies, politics and actions	195
8 General policies for the Great Transition	197

Barriers to change	198
What is a carbon price?	201
Is a carbon price necessary? Sufficient?	203
Carbon tax	208
Cap-and-trade emissions trading	210
Carbon tax or ETS?	216
Changing the economic system	219
Ending population growth without coercion	223
International agreements	224
Conclusion	226
9 Targeted policies for renewable energy	228
Barriers to technological maturity	229
Targets for sustainable energy	231
Feed-in tariffs	233
Tradable renewable energy certificates	235
Removing subsidies to fossil fuels and nuclear energy	237
Innovative finance for sustainable energy	239
Transmission infrastructure	242
Policies for renewable heating	243
New business models for electricity industry	244
Conclusion	254
10 Who will drive the transition?	257
Limits to individual action	258
Action by cooperatives and other community groups	263
Action by corporations	266
Conclusion	268
11 Citizen action	270
The unavoidable power struggle	272
'Organising' groups	275
Strategy	276
Tactics	278
What we can do	287
12 Conclusion	289
Proposed campaign strategy	292
Even bigger challenges lie ahead	294

Appendix: What you can do	295
References and notes	300
Glossary	327
Abbreviations	336
Units and conversion factors	338
Further reading	340
List of tables, figures and boxes	344
Index	346
