

TABLE OF CONTENTS

Preface

1.	Introduction	1
	A. Receptors, Ligands, and the Importance of Receptor Clustering in Transmembrane Signaling	1
	B. Quantitative Theories of Receptor Clustering	5
	C. A Two-Part Method for Calculating Receptor Clustering Dynamics .	7
	D. Other Methods of Solving Aggregation Problems	10
	E. Synopsis	11
2.	Branching Processes Applied to the Aggregation of f -Valent Particles . .	13
	A. The Galton-Watson Process	13
	B. Relationship Between the Galton-Watson Process and an Aggregation Process	15
	C. Probability Generating Functions	20
	D. Probability Generating Function for the Number of Offspring of an Individual in Generation r	20
	E. Weight Fraction Generating Function	22
	F. Lagrange Expansion	24
	G. Flory-Stockmayer Distribution	26
3.	Multitype Branching Processes	28
	A. Antigen-Antibody Reactions	28
	B. Terminology and Definitions	29
	C. Weight Fractions	34
4.	Aggregate Size Distribution on a Cell Surface	43
	A. General Considerations	43
	B. Bivalent Antigens	46
	C. Multivalent Antigens	50

TABLE OF CONTENTS (continued)

5.	Gelation and Infinite-Sized Trees	59
	A. General Considerations	59
	B. Gelation in a One-Type Process	62
	C. Gelation in a Two-Type Process (Antigen-Antibody Reactions)	66
	D. Infinite-Sized Aggregates on a Cell Surface	68
6.	Post-Gel Relations	74
7.	Conclusions and Extensions	84
	Appendices	88
	A. Proof of Theorem 2	88
	B. Interactions of g -Valent Antibody with f -Valent Antigen	93
	C. Generating Functions for Post-Gel Relations	100
	List of Symbols	105
	Bibliography	110
