About the author	xxi
I Classical optics in global vacuum	1
1 Heading for photon physics	3
2 Fundamentals of free electromagnetic fields	7
2.1 Maxwell equations and wave equations	7
2.2 Transverse and longitudinal vector fields	8
2.3 Complex analytical signals	10
2.4 Monochromatic plane-wave expansion of the electromagnetic field	13
2.5 Polarization of light	14
2.5.1 Transformation of base vectors	14
2.5.2 Geometrical picture of polarization states	15
2.6 Wave packets as field modes	18
2.7 Conservation of energy, moment of energy, momentum, and angular momentum	21
2.8 Riemann–Silberstein formalism	22
2.9 Propagation of analytical signal	24
3 Optics in the special theory of relativity	27
3.1 Lorentz transformations and proper time	27
3.2 Tensors	30
3.3 Four-vectors and -tensors	31
3.4 Manifest covariance of the free Maxwell equations	33
3.5 Lorentz transformation of the (transverse) electric and magnetic fields. Duality	35
3.6 Lorentz transformation of Riemann–Silberstein vectors. Inner-product invariance	38
II Light rays and geodesics. Maxwell theory in general relativity	39
4 The light-particle <i>and</i> wave pictures in classical physics	41
5 Eikonal theory and Fermat’s principle	45
5.1 Remarks on geometrical optics. Inhomogeneous vacuum	45
5.2 Eikonal equation. Geometrical wave surfaces and rays	47
5.3 Geodetic line: Fermat’s principle	52

6	Geodesics in general relativity	55
6.1	Metric tensor. Four-dimensional Riemann space	55
6.2	Time-like metric geodesics	56
6.3	The Newtonian limit: Motion in a weak static gravitational field	59
6.4	Null geodesics and "light particles"	61
6.5	Gravitational redshift. Photon in free fall	62
7	The space-time of general relativity	67
7.1	Tensor fields	67
7.2	Covariant derivative	69
7.3	Parallel transport	70
7.4	Riemann curvature tensor	71
7.5	Algebraic properties of the Riemann curvature tensor	73
7.6	Einstein field equations in general relativity	74
7.7	Metric compatibility	76
7.8	Geodesic deviation of light rays	76
8	Electromagnetic theory in curved space-time	79
8.1	Vacuum Maxwell equations in general relativity	79
8.2	Covariant curl and divergence in Riemann space	80
8.3	A uniform formulation of electrodynamics in curved and flat space-time	81
8.3.1	Maxwell equations with normal derivatives	81
8.3.2	Maxwell equations with \mathbf{E} , \mathbf{B} , \mathbf{D} , and \mathbf{H} fields	83
8.3.3	Microscopic Maxwell-Lorentz equations in curved space-time	84
8.3.4	Constitutive relations in curved space-time	85
8.3.5	Remarks on the constitutive relations in Minkowskian space	87
8.3.6	Permittivity and permeability for static metrics	88
8.4	Permittivity and permeability in expanding universe	89
8.5	Electrodynamics in potential description. Eikonal theory and null geodesics	91
8.6	Gauge-covariant derivative	95
III	Photon wave mechanics	97
9	The elusive light particle	99
10	Wave mechanics based on transverse vector potential	105
10.1	Gauge transformation. Covariant and noncovariant gauges	105
10.2	Tentative wave function and wave equation for transverse photons	107
10.3	Transverse photon as a spin-1 particle	110
10.4	Neutrino wave mechanics. Massive eigenstate neutrinos	113
11	Longitudinal and scalar photons. Gauge and near-field light quanta	119
11.1	L- and S-photons. Wave equations	119
11.2	L- and S-photon neutralization in free space	120
11.3	NF- and G-photons	122
11.4	Gauge transformation within the Lorenz gauge	124

12 Massive photon field	127
12.1 Proca equation	127
12.2 Dynamical equations for \mathbf{E} and \mathbf{A}	129
12.3 Diamagnetic interaction: Transverse photon mass	130
12.4 Massive vector boson (photon) field	132
12.5 Massive photon propagator	136
13 Photon energy wave function formalism	143
13.1 The Oppenheimer light quantum theory	143
13.2 Interlude: From spherical to Cartesian representation	146
13.3 Photons and antiphotons: Bispinor wave functions	150
13.4 Four-momentum and spin of photon wave packet	153
13.5 Relativistic scalar product. Lorentz-invariant integration on the energy shell	155
IV Single-photon quantum optics in Minkowskian space	159
14 The photon of the quantized electromagnetic field	161
15 Polychromatic photons	165
15.1 Canonical quantization of the transverse electromagnetic field	165
15.2 Energy, momentum, and spin operators of the transverse field	168
15.3 Monochromatic plane-wave photons. Fock states	171
15.4 Single-photon wave packets	173
15.5 New T-photon “mean” position state	177
15.6 T-photon wave function and related dynamical equation	179
15.7 The non-orthogonality of T-photon position states	181
16 Single-photon wave packet correlations	183
16.1 Wave-packet basis for one-photon states	183
16.2 Wave-packet photons related to a given t -matrix	184
16.3 Integral equation for the time evolution operator in the interaction picture	186
16.4 Atomic and field correlation matrices	189
16.5 Single-photon correlation matrix: The wave function fingerprint	194
17 Interference phenomena with single-photon states	197
17.1 Wave-packet mode interference	197
17.2 Young-type double-source interference	198
17.3 Interference between transition amplitudes	201
17.4 Field correlations in photon mean position state	201
17.4.1 Correlation supermatrix	202
17.4.2 Relation between the correlation supermatrix and the transverse pho- ton propagator	203
18 Free-field operators: Time evolution and commutation relations	205
18.1 Maxwell operator equations. Quasi-classical states	205
18.2 Generalized Landau–Peierls–Sudarshan equations	207
18.3 Commutation relations	208
18.3.1 Commutation relations at different times ($\tau \neq 0$)	209
18.3.2 Equal-time commutation relations	210

V	Photon embryo states	213
19	Attached photons in rim zones	215
20	Evanescent photon fields	221
20.1	Four-potential description in the Lorenz gauge	221
20.2	Sheet current density: T-, L-, and S-parts	223
20.3	Evanescent T-, L-, and S-potentials	225
20.4	Four-potential photon wave mechanics	229
20.5	Field-quantized approach	231
20.6	Near-field photon: Heisenberg equation of motion and coherent state	234
21	Photon tunneling	237
21.1	Near-field interaction. The photon measurement problem	237
21.2	Scattering of a wave-packet band from a single current-density sheet	238
21.3	Incident fields generating evanescent tunneling potentials	243
21.4	Interlude: Scalar propagator in various domains	246
21.5	Incident polychromatic single-photon state	247
21.6	Photon tunneling-coupled sheets	250
22	Near-field photon emission in 3D	255
22.1	T-, L-, and S-potentials of a classical point-particle	255
22.1.1	General considerations on source fields	255
22.1.2	Point-particle potentials	257
22.2	Čerenkov shock wave	260
22.2.1	Four-potential of point-particle in uniform motion in vacuum	260
22.2.2	Transverse and longitudinal response theory in matter	263
22.2.3	The transverse Čerenkov phenomenon	266
22.2.4	Momenta associated to the transverse and longitudinal parts of the Čerenkov field	269
22.2.5	Screened canonical particle momentum	272
VI	Photon source domain and propagators	275
23	Super-confined T-photon sources	277
24	Transverse current density in nonrelativistic quantum mechanics	283
24.1	Single-particle transition current density	283
24.2	The hydrogen $1s \leftrightarrow 2p_z$ transition	286
24.3	Breathing mode: Hydrogen $1s \leftrightarrow 2s$ transition	289
24.4	Two-level breathing mode dynamics	292
25	Spin-1/2 current density in relativistic quantum mechanics	297
25.1	Dirac matrices	297
25.2	Covariant form of the Dirac equation. Minimal coupling. Four-current density	299
25.3	Gordon decomposition of the Dirac four-current density	301
25.4	Weakly relativistic spin current density	303
25.5	Continuity equations for spin and space four-current densities	306

26 Massless photon propagators	309
26.1 From the Huygens propagator to the transverse photon propagator	309
26.2 T-photon time-ordered correlation of events	311
26.3 Covariant correlation matrix	313
26.4 Covariant quantization of the electromagnetic field: A brief review	314
26.5 The Feynman photon propagator	316
26.6 Longitudinal and scalar photon propagators	318
VII Photon vacuum and quanta in Minkowskian space	321
27 Photons and observers	323
28 The inertial class of observers: Photon vacuum and quanta	329
28.1 Transverse photon four-current density	329
28.2 Boosts	332
28.2.1 Lorentz and Lorenz-gauge transformations of the four-potential	332
28.2.2 Plane-mode decomposition of the covariant potential	333
28.2.3 Mode functions	336
28.3 Physical (T-photon) vacuum	337
29 The non-inertial class of observers: The nebulous particle concept	345
29.1 Bogolubov transformation. Vacuum states	345
29.2 The non-unique vacuum	348
29.3 The Unruh effect	352
29.3.1 Rindler space and observer	352
29.3.2 Rindler particles in Minkowski vacuum	354
30 Photon mass and hidden gauge invariance	363
30.1 Physical vacuum: Spontaneous symmetry breaking	363
30.2 Goldstone bosons	366
30.3 The $U(1)$ Higgs model	368
30.4 Photon mass and vacuum screening current	372
30.5 't Hooft gauge and propagator	373
VIII Two-photon entanglement in space-time	377
31 The quantal photon gas	379
32 Quantum measurements	385
32.1 Tensor product space (discrete case)	385
32.2 Definition of an observable (discrete case)	386
32.3 Reduction of the wave packet (discrete case)	387
32.4 Measurements on only one part of a two-part physical system	387
32.5 Entangled photon polarization states	390
33 Two-photon wave mechanics and correlation matrices	393
33.1 Two-photon two times wave function	393
33.2 Two-photon Schrödinger equation in direct space	396
33.3 Two-photon wave packet correlations	397
33.3.1 First-order correlation matrix	397
33.3.2 Second-order correlation matrix	399

34 Spontaneous one- and two-photon emissions	401
34.1 Two-level atom: Weisskopf–Wigner theory of spontaneous emission	401
34.1.1 Atom-field Hamiltonian in the electric-dipole approximation. RWA-model	401
34.1.2 Weisskopf–Wigner state vector	406
34.2 Two-level atom: Wave function of spontaneously emitted photon	409
34.2.1 Photon wave function in \mathbf{q} -space	409
34.2.2 The general photon wave function in \mathbf{r} -space	410
34.2.3 Genuine transverse photon wave function	411
34.2.4 Spontaneous photon emission in the atomic rim zone	413
34.3 Three-level atom: Spontaneous cascade emission	417
34.3.1 Two-photon state vector	417
34.3.2 Two-photon two-times wave function	420
34.3.3 The structure of $\Phi_{2,T}(\mathbf{r}_1, \mathbf{r}_2, t_1, t_2)$	422
34.3.4 Far-field part of $\Phi_{2,T}^{(1)}(\mathbf{r}_1, \mathbf{r}_2, t_1, t_2)$	425
Bibliography	429
