Preface	v
List of abbreviations	xiii
Chapter 1 Introduction	1
1.1 What is identification?	1
1.2 Why should we want a model?	1
1.2.1 Models to satisfy scientific curiosity	1
1.2.2 Models for prediction and control	2
1.2.3 Models for state estimation	3
1.2.4 Modelling for diagnosis of faults and inadequacies	4
1.2.5 Models for simulation and operator training	5
1.2.6 Models and serendipity	5
1.3 What sort of model?	5
1.3.1 Dynamical models; model order	6
1.3.2 Lumped models	7
1.3.3 Time-invariant models	8
1.3.4 Linear models	9
1.3.5 Other model categories	9
1.4 How do you construct a model?	15
1.4.1 Stages in identification	15
1.4.2 Constraints on identification methods and results	18
1.5 How to read this book	19
References	19
Problems	20
Chapter 2 Classical methods of identification: impulse, step and sine-wave testing	23
2.1 Time-domain description of response	23
2.1.1 Impulse response and initial-condition response	23
2.1.2 Discrete-time forced response: unit-pulse response	25
2.1.3 Step response	28
2.2 Direct measurement of impulse and step responses	28
2.2.1 Measurement of impulse response	28
2.2.2 Measurement of step response	29
2.3 Transform description of response	30
2.3.1 Identification of Laplace transfer function	31
2.3.2 Discrete-time transfer function	31

	2.3.3 Frequency transfer function	34
	2.3.4 Measurement of frequency transfer function	36
	References	39
	Problems	40
Chapter 3	Identification based on correlation functions	43
3.1	Time averaging to reduce effects of noise	43
3.1.1	Time-average relations between signals	43
3.1.2	Input-output relation in terms of correlation functions	44
3.1.3	Power spectral density; white noise	46
3.2	Correlation-based identification with special perturbation	49
3.2.1	White-noise test	49
3.2.2	Pseudo-random binary sequence test	50
	Further reading	55
	References	55
	Problems	56
Chapter 4	Least-squares model fitting	59
4.1	Finding the "best-fit" model	59
4.1.1	Least squares	59
4.1.2	Ordinary least squares	60
4.1.3	Orthogonality	64
4.1.4	Weighted least squares	68
4.2	Computational methods for ordinary least squares	69
4.2.1	Choleski factorisation	70
4.2.2	Golub-Householder technique	72
4.2.3	Householder transformation of regressor matrix	73
4.2.4	Singular-value decomposition	77
4.3	Non-linear least-squares estimation	78
4.3.1	Generalised normal equations	78
4.3.2	Gauss-Newton algorithm	79
4.3.3	Levenberg-Marquardt algorithm	81
4.4	Why bother with statistics?	82
	Further reading	83
	References	84
	Problems	84
Chapter 5	Statistical properties of estimators	87
5.1	Introduction	87
5.1.1	Bias of estimators	88
5.1.2	Unbiased linear estimator for linear-in-parameters model	91
5.2	Bias of least-squares estimate	92
5.2.1	Bias with regressors deterministic	92
5.2.2	Bias with regressors random	93
5.2.3	Bias due to noisily observed regressors: the "errors in variables" problem	93
5.2.4	Bias due to presence of output among regressors	94
5.2.5	Convergence, probability limits and consistency	96
5.3	Covariance of estimates	98
5.3.1	Definition of covariance	98

5.3.2	Covariance of linear functions of estimate; significance of minimum-covariance estimate	99
5.3.3	Covariance of ordinary least-square and weighted least-square estimates	101
5.3.4	Minimum-covariance property of ordinary least-squares when error is uncorrelated	102
5.3.5	Minimum-covariance estimate when error is autocorrelated/non-stationary: the Markov estimate	103
5.3.6	Instrumental variables	106
5.3.7	Minimum-mean-square-error estimation: ridge regression	109
5.3.8	Minimum-mean-square-error linear estimator and orthogonality	111
5.4	Efficiency	114
5.4.1	Cramér–Rao bound	114
5.4.2	Efficiency	117
	Further reading	118
	References	119
	Problems	119
Chapter 6	Optimal estimation, Bayes and maximum-likelihood estimators	121
6.1	Introduction	121
6.2	Bayesian approach to optimal estimation	121
6.2.1	Optimality: loss functions and risk	122
6.2.2	Posterior probability density of parameters; Bayes' rule	123
6.2.3	Bayes estimation: details	125
6.3	Minimum-risk estimators	128
6.3.1	Minimum quadratic cost	128
6.3.2	Minimum expected absolute error	130
6.3.3	Minimax estimator	131
6.3.4	"Most likely" estimate	132
6.3.5	Bayes estimation with Gaussian probability density function	132
6.4	Maximum-likelihood estimation	133
6.4.1	Conditional maximum-likelihood estimator	133
6.4.2	Maximum-likelihood estimator with Gaussian measurements and linear model	135
6.4.3	Unconditional maximum-likelihood estimator	135
6.4.4	Properties of maximum likelihood estimators	136
6.4.5	Maximum-likelihood estimation with Gaussian vector measurements and unknown regression-equation error covariance	138
6.5	Practical implications of this chapter	139
	Further reading	140
	References	140
	Problems	141
Chapter 7	Computational algorithms for identification	143
7.1	Assumptions and model form	143
7.1.1	Assumptions	143
7.1.2	Standard linear single-input–single output model	145

7.1.3	Output-error and equation-error algorithms	147
7.1.4	A.r.m.a.x. model	148
7.2	Batch (off-line) identification algorithms	149
7.2.1	Role of batch algorithms	149
7.2.2	Iterative generalised least squares	150
7.2.3	Maximum-likelihood algorithm	151
7.3	Recursive estimation	152
7.3.1	Linear unbiased updating	154
7.3.2	Minimum-covariance linear unbiased updating	155
7.3.3	Recursive minimum-covariance estimator derived from least squares	158
7.3.4	Information updating	162
7.4	Recursive identification including a noise-structure model	164
7.4.1	Extended least squares	164
7.4.2	Extended matrix method	166
7.4.3	Extended least squares as approximate maximum likelihood; recursive maximum likelihood 2	167
7.4.4	Stochastic approximation	168
7.4.5	Recursive instrumental variable algorithm	170
7.4.6	Prediction-error algorithms	174
*7.5	Convergence analysis for recursive identification algorithms	176
7.5.1	Formulation of an archetype algorithm	176
7.5.2	Asymptotic behaviour of archetype algorithm	179
7.5.3	Convergence theorems for archetype algorithm	182
	Further reading	184
	References	185
	Problems	187
Chapter 8	Specialised topics in identification	189
8.1	Recursive identification of linear, time-varying models	189
8.1.1	Role of time-varying models	189
8.1.2	Modification of recursive algorithms to track time variation	191
8.1.3	Recursive weighted-least-squares with a forgetting factor	191
8.1.4	Covariance resetting	192
8.1.5	Explicit modelling of parameter variation	192
8.1.6	Optimal smoothing	195
8.2	Identifiability	201
8.2.1	Factors affecting identifiability	201
8.2.2	Deterministic identifiability	203
8.2.3	Signal requirements for identifiability: persistency of excitation	206
*8.2.4	Persistency of excitation conditions and convergence	209
8.3	Identification in closed loop	212
8.3.1	Effects of feedback on identifiability	212
*8.3.2	Conditions on feedback and external inputs to ensure identifiability	215
8.3.3	Self-tuning control	217
8.4	Addition of regressors: recursion in model order	221
8.4.1	Order-incrementing equations	221

*8.4.2 Orthogonality in order-incrementing	223
8.4.3 Lattice algorithms and identification	225
8.5 Model reduction	225
8.5.1 Moment matching: Padé approximation	225
8.5.2 Continued-fraction approximation	227
8.5.3 Moment matching in discrete time	230
8.5.4 Other reduction methods	232
8.6 Recursive identification in bounded noise	233
8.6.1 Bounded-noise, parameter-bounding model	233
8.6.2 Recursive parameter-bounding algorithm: ellipsoidal bound	237
*8.6.3 Toleranced prediction	241
8.7 Identification of multivariable systems	242
8.7.1 Parameterisation of multi-input–multi-output models	242
8.7.2 Cost functions for multivariable models	245
8.8 Identification of non-linear systems	246
8.8.1 Volterra-series model	246
8.8.2 Block-oriented models	248
8.8.3 Regression models for non-linear systems	250
8.9 Simultaneous estimation of parameters and state	251
8.9.1 State augmentation and extended Kalman filtering	252
8.9.2 Alternated parameter and state estimation	254
8.9.3 Maximum-likelihood estimator	254
8.9.4 Bayes estimator	256
References	256
Problems	259
Chapter 9 Experiment design and choice of model structure	263
9.1 Introduction	263
9.2 Experiment design	263
9.2.1 Adequacy of input and output	263
*9.2.2 Optimisation of input	266
*9.2.3 Optimisation of output-sampling schedule	267
9.3 Selection of model structure	272
9.3.1 Model order determination	272
9.3.2 <i>F</i> test	274
9.3.3 The Akaike information criterion	275
9.3.4 Product-moment matrix test	277
9.4 Summary	281
Further reading	281
References	282
Problems	283
Chapter 10 Model validation	285
10.1 Introduction	285
10.1.1 Nature of validation tests	285
10.1.2 What do we test?	287
10.2 Checks before and during estimation	287
10.2.1 Checks on records	287
10.2.2 Checks on parameter estimates	288
10.2.3 Checks on residuals	290
10.2.4 Checks on covariance	292

10.3	Post-estimation checks	293
10.3.1	Employment of time-varying models	293
10.3.2	Checks on parameter estimates	294
10.3.3	Checks on residuals	296
10.3.4	Simulation-mode runs	300
10.3.5	Informal checks	302
10.4	Epilogue	303
	Further reading	303
	References	304
	Subject index	305
