

Contents

- 1 *The objectives of preventive medicine* 1
The scope for prevention. Why seek to prevent?
the economic and humanitarian arguments.
Priorities: a matter of choice.
- 2 *What needs to be prevented?* 6
Sick individuals: a continuum of disease severity;
case definitions. A continuum of risk: the
prevention paradox; mass and individual measures.
A unified approach.
- 3 *The relation of risk to exposure* 15
The dose–effect relationship. The limitations of
research methods. Small but widespread risks: a
public health disaster? Conclusions.
- 4 *Prevention for individuals and the
'high-risk' strategy* 29
Prevention and clinical care. The high-risk strategy.
Identifying risk: screening. Strengths and
weaknesses of the high-risk strategy.
- 5 *Individuals and populations* 53
Individual variation: genetic, social, and behavioural
determinants of diversity. Variation between
populations. Sick and healthy populations.
- 6 *Some implications of population change* 64
Effects of the population average on the occurrence
of deviance; examples from mental health. Health
implications for the population as a whole: cardio-
vascular disease; body weight; birth weight; early

	development and adult health; Down's syndrome; alcohol; osteoporosis and fractures; occupational and environmental health; other fields of application. Safety.	
7	<i>The population strategy of prevention</i>	95
	Principles: the sociological, moral and medical arguments; scope; proximal and underlying causes. Strengths. Limitations and problems.	
8	<i>In search of health</i>	107
	How do populations change? the alcohol example. Scientific justification for change. Social engineering versus individual freedom. Freedom of choice. Role of governments. Who takes the decisions? The largest threat to public health: war. Social and economic deprivation. Responsibility for health.
