Part I Single species populations	1
1 Density independent growth	5
1.1 Introduction	5
1.2 Fundamentals of population growth	8
1.3 Types of models	10
1.4 Density independent versus density dependent growth	12
1.5 Discrete or “geometric” growth in populations with non-overlapping generations	12
1.6 Exponential growth in populations with overlapping generations	16
1.7 Examples of exponential growth	18
1.8 Applications to human populations	19
1.9 The finite rate of increase (λ) and the intrinsic rate of increase (r)	23
1.10 Stochastic models of population growth and population viability analysis	25
1.11 Conclusions	30
References	30
2 Density dependent growth and intraspecific competition	33
2.1 Introduction	33
2.2 Density dependence in populations with discrete generations	37
2.3 Density dependence in populations with overlapping generations	42
2.4 Nonlinear density dependence of birth and death rates and the Allee effect	46
2.5 Time lags and limit cycles	51
2.6 Chaos and behavior of the discrete logistic model	53
2.7 Adding stochasticity to density dependent models	54
2.8 Laboratory and field data	55
2.9 Behavioral aspects of intraspecific competition	60
2.10 Summary	64
References	64

3	Population regulation	69
3.1	Introduction	69
3.2	What is population regulation?	70
3.3	Combining density-dependent and density-independent factors	71
3.4	Tests of density dependence	73
3.5	Summary	77
	References	78
4	Populations with age structures	81
4.1	Introduction	81
4.2	Survivorship	83
4.3	Fertility	90
4.4	Mortality curves	94
4.5	Expectation of life	96
4.6	Net reproductive rate, generation time, and the intrinsic rate of increase	97
4.7	Age structure and the stable age distribution	99
4.8	Projecting population growth in age-structured populations	99
4.9	The Leslie or population projection matrix	102
4.10	A second version of the Leslie matrix	103
4.11	The Lefkovitch modification of the Leslie matrix	104
4.12	Dominant latent roots and the characteristic equation	105
4.13	Reproductive value	107
4.14	Conclusions: sensitivity analysis	109
	References	112
5	Metapopulation ecology	115
5.1	Introduction	115
5.2	Metapopulations and spatial ecology	116
5.3	MacArthur and Wilson and the equilibrium theory	120
5.4	The Levins or classical metapopulation	124
5.5	Lande's extension of the Levins model	125
5.6	Extinction in metapopulations	127
5.7	Metapopulation dynamics of two local populations	127
5.8	Source-sink metapopulations and the rescue effect	129
5.9	Nonequilibrium and patchy metapopulations	130
5.10	Spatially realistic models	130
5.11	Assumptions and evidence for the existence of metapopulations in nature	135
5.12	Summary	138
	References	139
6	Life history strategies	145
6.1	Introduction	145
6.2	Power laws	149
6.3	The metabolic theory of ecology	152
6.4	Cole and Lewontin	154

6.5	The theory of <i>r</i> - and <i>K</i> -selection versus fast and slow life histories	159
6.6	Cost of reproduction and allocation of energy	162
6.7	Clutch size	163
6.8	Latitudinal gradients in clutch size	164
6.9	The effects of predation and disease on life history characteristics	165
6.10	Bet-hedging	166
6.11	The Grime general model for three evolutionary strategies in plants	166
6.12	Summary	168
	References	168
Part 2 Interspecific interactions among populations		173
7	Interspecific competition	177
7.1	Introduction	177
7.2	Interspecific competition: early experiments and the competitive exclusion principle	178
7.3	The Lotka–Volterra competition equations	180
7.4	Laboratory experiments and competition	186
7.5	Resource-based competition theory	187
7.6	Spatial competition and the competition-colonization trade-off	194
7.7	Evidence for competition from nature	196
7.8	Indirect evidence for competition and “natural experiments”	198
7.9	Summary	205
	References	205
8	Mutualism	209
8.1	Introduction	209
8.2	Ant–plant mutualisms	210
8.3	Modeling mutualism	215
8.4	Summary: the costs of mutualism	217
	References	217
9	Host–parasite interactions	221
9.1	Introduction	221
9.2	Factors affecting microparasite population biology	223
9.3	Modeling host–microparasite interactions	224
9.4	Dynamics of the disease	226
9.5	Immunization	229
9.6	Endangered metapopulations and disease	230
9.7	Social parasites	232
9.8	Summary	235
	References	235
10	Predator/prey interactions	239
10.1	Introduction	239
10.2	The Lotka–Volterra equations	248

10.3	Early tests of the Lotka–Volterra models	250
10.4	Functional responses	252
10.5	Adding prey density dependence and the type II and III functional responses to the Lotka–Volterra equations	256
10.6	The graphical analyses of Rosenzweig and MacArthur	258
10.7	Use of a half saturation constant in predator/prey interactions	262
10.8	Parasitoid/host interactions and the Nicholson–Bailey models	264
10.9	Section summary	267
10.10	Field studies	268
10.11	The dangers of a predatory lifestyle	277
10.12	Escape from predation	277
10.13	Summary	281
	References	282
11	Plant–herbivore interactions	287
11.1	Introduction	287
11.2	Classes of chemical defenses	289
11.3	Constitutive versus Induced Defense	294
11.4	Plant communication	296
11.5	Novel defenses/herbivore responses	296
11.6	Detoxification of plant compounds by herbivores	297
11.7	Plant apparency and chemical defense	298
11.8	Soil fertility and chemical defense	299
11.9	Modeling plant–herbivore population dynamics	299
11.10	Summary: the complexities of herbivore–plant interactions	303
	References	306
12	Multi-trophic interactions	311
	<i>Jonathan W. Witt</i>	
12.1	Introduction	311
12.2	Trophic cascades	312
12.3	Trophic cascades and antropogenic change	317
12.4	Intraguild predation	319
12.5	Intraguild predation and prey suppression	321
12.6	Intraguild predation and mesopredator release	322
12.7	Cannibalism	323
	References	326
Appendix 1:	Problem sets	333
Appendix 2:	Matrix algebra: the basics	337
Appendix 3:	List of mathematical symbols used in this book	343
