

CONTENTS

FOREWORD by <i>David G. Wright, M.D.</i>	v
------------------------------------------------	---

PART I: QUANTIFICATION

1. Introduction	3
Historical review; theoretical approach.	
2. Administration and Scoring	10
Test administration; directions, precautions; scoring; development of scoring system, item analyses, weighting.	
3. Reliability	15
Scorer reliability, validity coefficients for two independent scorers; test reliability; effect of practice	
4. Test Standardization	19
Description of population; scores as a function of sex, drawing ability, I.Q., age, and education; standard (Z) scores.	
5. Test Validity	27
Validity studies on matched groups, using raw scores; validity, using standard scores—population 474 normal adults and 356 adult psychiatric patients; study of test scores and Wechsler-Bellevue scatter; study of prognostic indication from test scores; use of the Bender-Gestalt in following the course of electroconvulsive therapy; use of the Bender-Gestalt as a screening device.	

PART II: CLINICAL USE OF THE BENDER-GESTALT TEST

6. Introduction	39
7. The Records of Children and Those with Cortical Deficit	41
Records of children, discussion of the deviations in each of the designs; comparison of records of mental defectives and of individuals with cortical damage with the records of children.	
8. The Bender-Gestalt Test and Psychogenic Disorders	67
Use of the Bender-Gestalt in clinical practice, discussion of high-scoring records, of low-scoring records, and of fluctuation of score on repetition of the test; some deviations as characteristic of diagnostic category.
