Preface to the Second Edition	xv
Preface to the First Edition	xvii
Chapter 1. Vector spaces	1
§1.1. Preview	1
§1.2. The abstract definition of a vector space	2
§1.3. Some definitions	5
§1.4. Mappings	11
§1.5. Triangular matrices	13
§1.6. Block triangular matrices	17
§1.7. Schur complements	18
§1.8. Other matrix products	20
Chapter 2. Gaussian elimination	21
§2.1. Some preliminary observations	22
§2.2. Examples	24
§2.3. Upper echelon matrices	30
§2.4. The conservation of dimension	36
§2.5. Quotient spaces	38
§2.6. Conservation of dimension for matrices	38
§2.7. From U to A	40
§2.8. Square matrices	41
Chapter 3. Additional applications of Gaussian elimination	45

§3.1. Gaussian elimination redux	45
§3.2. Properties of BA and AC	48
§3.3. Extracting a basis	50
§3.4. Computing the coefficients in a basis	51
§3.5. The Gauss-Seidel method	52
§3.6. Block Gaussian elimination	55
§3.7. $\{0, 1, \infty\}$	56
§3.8. Review	57
Chapter 4. Eigenvalues and eigenvectors	61
§4.1. Change of basis and similarity	62
§4.2. Invariant subspaces	64
§4.3. Existence of eigenvalues	64
§4.4. Eigenvalues for matrices	66
§4.5. Direct sums	69
§4.6. Diagonalizable matrices	72
§4.7. An algorithm for diagonalizing matrices	74
§4.8. Computing eigenvalues at this point	75
§4.9. Not all matrices are diagonalizable	77
§4.10. The Jordan decomposition theorem	80
§4.11. An instructive example	81
§4.12. The binomial formula	83
§4.13. More direct sum decompositions	84
§4.14. Verification of Theorem 4.13	87
§4.15. Bibliographical notes	89
Chapter 5. Determinants	91
§5.1. Functionals	91
§5.2. Determinants	92
§5.3. Useful rules for calculating determinants	95
§5.4. Eigenvalues	98
§5.5. Exploiting block structure	101
§5.6. The Binet-Cauchy formula	103
§5.7. Minors	105
§5.8. Uses of determinants	109
§5.9. Companion matrices	110

§5.10. Circulants and Vandermonde matrices	111
Chapter 6. Calculating Jordan forms	113
§6.1. Overview	114
§6.2. Structure of the nullspaces \mathcal{N}_{B^j}	114
§6.3. Chains and cells	116
§6.4. Computing J	117
§6.5. An algorithm for computing U	118
§6.6. A simple example	120
§6.7. A more elaborate example	122
§6.8. Jordan decompositions for real matrices	125
§6.9. Projection matrices	128
§6.10. Companion and generalized Vandermonde matrices	128
Chapter 7. Normed linear spaces	133
§7.1. Four inequalities	133
§7.2. Normed linear spaces	138
§7.3. Equivalence of norms	140
§7.4. Norms of linear transformations	142
§7.5. Operator norms for matrices	144
§7.6. Mixing tops and bottoms	146
§7.7. Evaluating some operator norms	146
§7.8. Inequalities for multiplicative norms	148
§7.9. Small perturbations	151
§7.10. Bounded linear functionals	154
§7.11. Extensions of bounded linear functionals	155
§7.12. Banach spaces	158
§7.13. Bibliographical notes	160
Chapter 8. Inner product spaces and orthogonality	161
§8.1. Inner product spaces	161
§8.2. A characterization of inner product spaces	164
§8.3. Orthogonality	165
§8.4. Gram matrices	167
§8.5. Projections and direct sum decompositions	168
§8.6. Orthogonal projections	170
§8.7. Orthogonal expansions	173

§8.8.	The Gram-Schmidt method	175
§8.9.	Toeplitz and Hankel matrices	176
§8.10.	Adjoins	178
§8.11.	The Riesz representation theorem	182
§8.12.	Normal, selfadjoint and unitary transformations	184
§8.13.	Auxiliary formulas	186
§8.14.	Gaussian quadrature	187
§8.15.	Bibliographical notes	190
Chapter 9.	Symmetric, Hermitian and normal matrices	191
§9.1.	Hermitian matrices are diagonalizable	192
§9.2.	Commuting Hermitian matrices	194
§9.3.	Real Hermitian matrices	196
§9.4.	Projections and direct sums in \mathbb{F}^n	197
§9.5.	Projections and rank	201
§9.6.	Normal matrices	202
§9.7.	QR factorization	204
§9.8.	Schur's theorem	205
§9.9.	Areas, volumes and determinants	207
§9.10.	Boundary value problems	212
§9.11.	Bibliographical notes	212
Chapter 10.	Singular values and related inequalities	213
§10.1.	Singular value decompositions	213
§10.2.	Complex symmetric matrices	218
§10.3.	Approximate solutions of linear equations	220
§10.4.	Fitting a line in \mathbb{R}^2	221
§10.5.	Fitting a line in \mathbb{R}^p	222
§10.6.	Projection by iteration	223
§10.7.	The Courant-Fischer theorem	224
§10.8.	Inequalities for singular values	228
§10.9.	von Neumann's inequality for contractive matrices	235
§10.10.	Bibliographical notes	236
Chapter 11.	Pseudoinverses	237
§11.1.	Pseudoinverses	237
§11.2.	The Moore-Penrose inverse	244

§11.3.	Best approximation in terms of Moore-Penrose inverses	247
§11.4.	Drazin inverses	249
§11.5.	Bibliographical notes	250
Chapter 12.	Triangular factorization and positive definite matrices	251
§12.1.	A detour on triangular factorization	252
§12.2.	Definite and semidefinite matrices	254
§12.3.	Characterizations of positive definite matrices	256
§12.4.	An application of factorization	259
§12.5.	Positive definite Toeplitz matrices	260
§12.6.	Detour on block Toeplitz matrices	266
§12.7.	A maximum entropy matrix completion problem	271
§12.8.	A class of $A \succ O$ for which (12.52) holds	275
§12.9.	Schur complements for semidefinite matrices	277
§12.10.	Square roots	280
§12.11.	Polar forms	282
§12.12.	Matrix inequalities	283
§12.13.	A minimal norm completion problem	286
§12.14.	A description of all solutions to the minimal norm completion problem	288
§12.15.	Bibliographical notes	289
Chapter 13.	Difference equations and differential equations	291
§13.1.	Systems of difference equations	292
§13.2.	Nonhomogeneous systems of difference equations	293
§13.3.	The exponential e^{tA}	294
§13.4.	Systems of differential equations	296
§13.5.	Uniqueness	298
§13.6.	Isometric and isospectral flows	299
§13.7.	Second-order differential systems	300
§13.8.	Stability	301
§13.9.	Nonhomogeneous differential systems	301
§13.10.	Strategy for equations	302
§13.11.	Second-order difference equations	303
§13.12.	Higher order difference equations	306
§13.13.	Second-order differential equations	307
§13.14.	Higher order differential equations	309

§13.15. Wronskians	311
§13.16. Variation of parameters	313
Chapter 14. Vector-valued functions	315
§14.1. Mean value theorems	315
§14.2. Taylor's formula with remainder	316
§14.3. Application of Taylor's formula with remainder	317
§14.4. Mean value theorem for functions of several variables	318
§14.5. Mean value theorems for vector-valued functions of several variables	319
§14.6. A contractive fixed point theorem	321
§14.7. Newton's method	324
§14.8. A refined contractive fixed point theorem	327
§14.9. Spectral radius	328
§14.10. The Brouwer fixed point theorem	332
§14.11. Bibliographical notes	336
Chapter 15. The implicit function theorem	337
§15.1. Preliminary discussion	337
§15.2. The implicit function theorem	339
§15.3. A generalization of the implicit function theorem	344
§15.4. Continuous dependence of solutions	346
§15.5. The inverse function theorem	347
§15.6. Roots of polynomials	349
§15.7. An instructive example	349
§15.8. A more sophisticated approach	351
§15.9. Dynamical systems	353
§15.10. Lyapunov functions	355
§15.11. Bibliographical notes	357
Chapter 16. Extremal problems	359
§16.1. Classical extremal problems	359
§16.2. Convex functions	363
§16.3. Extremal problems with constraints	366
§16.4. Examples	368
§16.5. Krylov subspaces	374
§16.6. The conjugate gradient method	374

§16.7. Dual extremal problems	379
§16.8. Linear programming	381
§16.9. Bibliographical notes	386
Chapter 17. Matrix-valued holomorphic functions	387
§17.1. Differentiation	387
§17.2. Contour integration	391
§17.3. Evaluating integrals by contour integration	396
§17.4. A short detour on Fourier analysis	400
§17.5. The Hilbert matrix	403
§17.6. Contour integrals of matrix-valued functions	404
§17.7. Continuous dependence of the eigenvalues	407
§17.8. More on small perturbations	408
§17.9. Spectral radius redux	410
§17.10. Fractional powers	413
§17.11. Bibliographical notes	414
Chapter 18. Matrix equations	415
§18.1. The equation $X - AXB = O$	415
§18.2. The Sylvester equation $AX - XB = C$	418
§18.3. $AX = XB$	421
§18.4. Special classes of solutions	422
§18.5. Riccati equations	424
§18.6. Two lemmas	430
§18.7. An LQR problem	432
§18.8. Bibliographical notes	434
Chapter 19. Realization theory	435
§19.1. Minimal realizations	442
§19.2. Stabilizable and detectable realizations	449
§19.3. Reproducing kernel Hilbert spaces	450
§19.4. de Branges spaces	453
§19.5. R_α invariance	455
§19.6. A left tangential Nevanlinna-Pick interpolation problem	456
§19.7. Factorization of $\Theta(\lambda)$	462
§19.8. Bibliographical notes	465
Chapter 20. Eigenvalue location problems	467

§20.1.	Interlacing	467
§20.2.	Sylvester's law of inertia	470
§20.3.	Congruence	472
§20.4.	Counting positive and negative eigenvalues	474
§20.5.	Exploiting continuity	477
§20.6.	Geršgorin disks	478
§20.7.	The spectral mapping principle	480
§20.8.	Inertia theorems	480
§20.9.	An eigenvalue assignment problem	483
§20.10.	Bibliographical notes	486
Chapter 21.	Zero location problems	487
§21.1.	Bezoutians	487
§21.2.	The Barnett identity	492
§21.3.	The main theorem on Bezoutians	493
§21.4.	Resultants	495
§21.5.	Other directions	499
§21.6.	Bezoutians for real polynomials	501
§21.7.	Stable polynomials	502
§21.8.	Kharitonov's theorem	504
§21.9.	Bibliographical notes	505
Chapter 22.	Convexity	507
§22.1.	Preliminaries	507
§22.2.	Convex functions	509
§22.3.	Convex sets in \mathbb{R}^n	512
§22.4.	Separation theorems in \mathbb{R}^n	513
§22.5.	Hyperplanes	515
§22.6.	Support hyperplanes	516
§22.7.	Convex hulls	517
§22.8.	Extreme points	520
§22.9.	Brouwer's theorem for compact convex sets	522
§22.10.	The Minkowski functional	523
§22.11.	The numerical range	525
§22.12.	Eigenvalues versus numerical range	528
§22.13.	The Gauss-Lucas theorem	529

§22.14. The Heinz inequality	530
§22.15. Extreme points for polyhedra	532
§22.16. Bibliographical notes	536
Chapter 23. Matrices with nonnegative entries	537
§23.1. Perron-Frobenius theory	538
§23.2. Stochastic matrices	544
§23.3. Behind Google	545
§23.4. Doubly stochastic matrices	546
§23.5. An inequality of Ky Fan	550
§23.6. The Schur-Horn convexity theorem	552
§23.7. Bibliographical notes	558
Appendix A. Some facts from analysis	559
§A.1. Convergence of sequences of points	559
§A.2. Convergence of sequences of functions	560
§A.3. Convergence of sums	560
§A.4. Sups and infs	561
§A.5. Topology	562
§A.6. Compact sets	562
§A.7. Normed linear spaces	562
Appendix B. More complex variables	565
§B.1. Power series	565
§B.2. Isolated zeros	567
§B.3. The maximum modulus principle	569
§B.4. $\ln(1 - \lambda)$ when $ \lambda < 1$	569
§B.5. Rouché's theorem	570
§B.6. Liouville's theorem	572
§B.7. Laurent expansions	572
§B.8. Partial fraction expansions	573
Bibliography	575
Notation Index	579
Subject Index	581
