

CONTENTS

I. The Nature of Non-Segmental Linear Manuscript Data	7
Illustration of the manuscript data (1). The need to integrate linguistic, metrical, and manuscript data (8-12), in view of Bliss's scansion (8-9) and Joynes' scansion (9-12). The nature of spacing variation in the Nowell Codex (12-17), with illustration from <i>Beowulf</i> (12-15) and prose texts (15-17).	
II. Potentialities of Notation Systems for Prosodic Features	18
Spacing does not occur systematically only at 'word' boundaries, but in some systematic relation to phonological phrasing (18). Analysis of probabilities for scribal 'writing' of non-segmental features of a (spoken) text: non-alphabetic diacritics (19), punctuation (19), reduplication in spelling (19), spacing (19-21), 'accents' (21-23). Only spacing seems to be operative in the Nowell Codex (23). The mode of analysis (using 'suprasegmentals') (24); the assumption of 'suprasegmentals' for Old English (24-25).	
III. Graphotactic Patterns in Some Fixed-Phrase Constructions.	26
Analysis of spacing within compound names: spacing not correlated with section divisions in the MS. (26), nor with position in verse line (26), nor with grammatical case inflections (26-30), nor with difference in the two scribal hands (30-32), nor with metrical patterns according to Bliss or Pope (32). Rather, variation in spacing is correlated in some way with syntax (32-34) and is consistent with the assumption that Old English is 'stress-timed' (34-37). Some tests of the extent of scribal deviation from the syntax-meter-spacing pattern of correlation (37-40).	
IV. Phonological and Syntactic Correlates of Some Graphotactic Patterns . .	41
Analysis of spacing within compounds other than names: spacing not correlated solely with morphology or syntax (41-46). Phonological factors are also operative: disyllabic first-element of compounds (46-49) and with consonant terminations (49-52) and vocalic terminations of first-element of compounds (52-53). Comparison of prose and verse texts (53-57). Comparison of name and non-name compounds (57-59). Correlation of spacing, syntax, and stress-timing (59-60).	
V. Graphotactic Evidence for the Meter of <i>Beowulf</i>	61
Analysis of continuous text: distinctive verse half-line spacing is prevalent (61-64), and is superseded only when syllable rate exceeds the norm (64-67). Spacing is directly correlated to timing (67). The relation of manuscript evidence to earlier formulations of meter (67-70). The evidence for isochronic meter (70-72), and the extent and preciseness of that evidence (72-73).	

VI. The Suprasegmentals and Meter of <i>Beowulf</i>	74
Analysis of continuous text: metrical stress (74-76), alliteration (76-77), extra-metrical lines (77-78). The convergent evidence for pitch features and their relation to junctures (78-80). The reconstruction of meter and suprasegmentals from the manuscript of <i>Beowulf</i> (81-83).
