	Preface	xi
<b>Chapter 1</b>	Introduction	1
<b>Chapter 2</b>	Linear Algebra Background	5
2.A	List of Things Students Should Know	5
<b>Chapter 3</b>	Types and Sources of Matrix Computational Problems	17
3.A	Linear Systems of Equations, $Ax = b$	17
3.B	Matrix Equations, $AX = B$	22
3.C	Matrix Inverses, $A^{-1}$	22
3.D	Determinants, $\det(A)$	23
<b>Chapter 4</b>	Types of Matrices That Arise	25
4.A	Special Matrices That Arise from Applications	25
4.B	Special Matrices That Arise from Analysis	28
<b>Chapter 5</b>	Gauss Elimination and LU Factorization	33
5.A	The Basic Algorithm and Theorem	33
5.B	Pivoting in Gauss Elimination	38
5.C	The Algorithm, Some Variations and Some Properties	42

<b>Chapter 6</b>	<b>Mathematical Software Objectives</b>	53
6.A	Software Philosophy	53
6.B	Algorithmic Objectives	55
6.C	Library Software Objectives	56
6.D	Case Study: Design of the Interface for a Linear Equation Solver	59
<b>Chapter 7</b>	<b>Mathematical Software Performance Evaluation</b>	63
7.A	Compiler Effects on Portability and Efficiency	63
7.B	Testing and Evaluation of Matrix Computation Software	66
7.C	Reporting Computational Experiments	72
7.D	The Algorithm Selection Problem	74
<b>Chapter 8</b>	<b>How Do You Know You Have the Right Answers?</b>	89
8.A	Polynomial Regression and the Hilbert Matrix	89
8.B	Condition Numbers	91
8.C	Sensitivity Analysis	95
8.D	Iterative Improvement	96
8.E	Comparison of Error-Estimation Procedures	98
<b>Chapter 9</b>	<b>Conditioning and Backward Error Analysis</b>	109
9.A	The Conditioning of a Problem and of a Computation	109
9.B	Condition Numbers Revisited	112
9.C	Composite Error Estimator and Algorithms	115
9.D	Backward Error Analysis	121
<b>Chapter 10</b>	<b>Iterative Methods</b>	137
10.A	Introduction to Iterative Methods	137
10.B	When Iterative Methods Should Be Considered	141
<b>Chapter 11</b>	<b>Linear Least Squares and Regression</b>	145
11.A	The Least-Squares Problem	145
11.B	The Normal Equations Approach	148
11.C	The Gram-Schmidt Orthogonalization Approach	149
11.D	The Orthogonal Matrix Factorization Approach	152
11.E	The Lawson-Hanson Book: Solving Least-Squares Problems	155

<b>Chapter 12</b>	<b>Projects</b>	159
1	Study of Gauss Elimination	160
2	Programming Language Effects on Linear Equations Software	161
3	Study of Band Matrix Solvers	161
4	Programming Languages and Style Effects on Mathematical Software	162
5	Robustness of Linear Equation Solvers	165
6	Evaluation of Library Linear Equation Solvers	166
7	Direct and Iterative Methods for Linear Systems from Differential Equations Boundary Value Problems	166
8	Solution of Linear Equations from Partial Differential Equation Boundary Value Problems	167
9	Direct and Iterative Methods for Ill-Conditioned Linear Systems	168
10	Elementary Reflections for $A\mathbf{x} = \mathbf{b}$	169
11	Elementary Rotations for $A\mathbf{x} = \mathbf{b}$	169
12	Jordan Elimination for $A\mathbf{x} = \mathbf{b}$	169
13	Experimental Determination of Optimum SOR Overrelaxation Factor	170
14	Experiments with Gauss-Seidel and Jacobi Iteration	170
15	Directed Gauss-Seidel versus Gauss-Seidel	171
16	Study of Gram-Schmidt and Modified Gram-Schmidt	172
17	Evaluation of Linear Least-Squares Methods	172
18	Modified Gram-Schmidt with Pivoting	173
	<b>Appendix: Standard Linear Algebra Software</b>	175
A	The BLAS: Basic Linear Algebra Subroutines	177
B	The LINPACK Programs	187
C	The IMSL Library Programs for Linear Algebraic Equations	201
D	The NAG Library Programs for Simultaneous Linear Equations	213
E	The Lawson-Hanson Least-Squares Programs	227
F	EISPACK—Matrix Eigensystem Routines	233
G	The Local Computing Center Library—Purdue Example	235
