FOREWORD .....	xi
AUTHORS' PREFACE .....	xiii
CHAPTER	
8 TIME DOMAIN ANALYSIS OF FILTERING AND SMOOTHING PROBLEMS .....	555
8.1. Introduction .....	555
8.2. The Mathematical Instruments of Filtering Theory .....	556
8.2.1 Probabilistic concepts .....	557
8.2.2 A Hilbert space of random variables .....	561
8.2.3 Stochastic processes .....	567
8.2.4 The Wiener process and the white-noise model .....	578
8.2.5 Stochastic integration, Hilbert spaces and estimation .....	580
8.2.6 Multivariable stochastic system description .....	586
8.3. The State Estimation Problem .....	593
8.3.1 The innovations signal process .....	594
8.3.2 The Kalman–Bucy filter .....	599
8.3.3 Wiener–Hopf equation and the optimal filter .....	609
8.4. Discrete-Time Filtering, Smoothing and Prediction Problems .....	615
8.4.1 Discrete-time Kalman filter .....	616
8.4.2 Prediction and smoothing .....	622
8.4.3 Computational problems in estimation .....	624
8.5. Conclusions .....	625
8.6. Problems .....	626
8.7. References .....	627
CHAPTER	
9 FREQUENCY DOMAIN ANALYSIS OF FILTERING AND SMOOTHING PROBLEMS ..	630
9.1. Introduction .....	630
9.2. Frequency Domain Properties of Kalman Filters .....	632
9.2.1 Kalman–Bucy filtering examples .....	632
9.2.2 Low-frequency gain .....	638
9.2.3 Zeros of the optimal filter .....	642
9.2.4 Signal to signal-plus-noise ratio .....	645
9.2.5 Analysis of the filtering problem in the $s$ -domain .....	647
9.2.6 Industrial examples .....	649
9.3. Finite-time Estimation .....	653
9.3.1 Discrete-time system and estimator description .....	654

9.3.2 Time-invariant estimation problem .....	657
9.3.3 Necessary and sufficient condition for optimality .....	661
9.3.4 Solution for the discrete-time estimator in the $z$ -domain .....	665
9.3.5 Time-invariant estimator: Theorem and examples .....	688
9.3.6 Calculation of the time-invariant estimator .....	676
9.3.7 Relationship to the Kalman filter .....	680
9.3.8 Continuous-time $s$ -domain results .....	682
9.4. Conclusions .....	684
9.5. Problems .....	686
9.6. References .....	688

## CHAPTER

10 TIME-DOMAIN ANALYSIS OF THE OPTIMAL STOCHASTIC LINEAR CONTROL PROBLEM .....	691
10.1. Introduction .....	691
10.2. The Continuous-time Linear Stochastic Regulator Problem .....	691
10.2.1 Abstract probability theory. ....	692
10.2.2 Stochastic processes revisited. ....	695
10.2.3 The linear stochastic regulator problem. ....	698
10.2.4 The stochastic linear regulator with complete state observations .....	701
10.2.5 The stochastic linear regulator with incomplete observations. ....	713
10.2.6 Time-invariant systems and steady state cost-functionals. ....	723
10.3. The Discrete-Time Linear Stochastic Regulator Problem .....	726
10.3.1 Quadratic covariance summation and difference equations	727
10.3.2 Discrete-time stochastic linear regulator problem with complete state observations. ....	731
10.3.3 Discrete-time stochastic linear regulator problem with incomplete state observations. ....	736
10.3.4 Implications of the separation principle for time-varying systems .....	740
10.4. Extensions and Assessment of Time-domain Linear Quadratic Gaussian Controllers .....	741
10.4.1 Reduced order LQG controllers. ....	741
10.4.2 State and state-estimate feedback. ....	742
10.4.3 Time delays. ....	742
10.4.4 Integral control action. ....	743
10.4.5 Robustness and guaranteed stability margins for LQG regulators. ....	744
10.4.6 Sensitivity and robust recovery procedures. ....	745
10.4.7 Systems with random parameters. ....	746
10.4.8 Dual performance criterion. ....	747
10.4.9 Self-tuning LQG controllers. ....	748
10.5. Conclusions .....	748
10.6. References .....	749

## CHAPTER

11 THE FREQUENCY DOMAIN ANALYSIS OF THE STOCHASTIC CONTROL PROBLEM .....	752
--	-----

11.1.	Introduction .....	752
11.2.	Aspects of the Theory of Polynomial Matrices .....	754
11.2.1	Polynomial theory .....	755
11.2.2	Polynomial matrices and matrix fractions .....	757
11.2.3	Polynomial Diophantine equations .....	764
11.3.	Polynomial Representations for Stochastic Systems .....	766
11.3.1	ARMAX models and the polynomial representation .....	767
11.3.2	State-space and polynomial system concepts .....	770
11.3.3	Stochastic system models for the LQG problem .....	774
11.3.4	Signal analysis and power spectra .....	779
11.3.5	The class of stabilizing controllers .....	787
11.4.	The LQG Stochastic Optimal Control Problem .....	796
11.4.1	System, controller, and cost functional .....	796
11.4.2	Solvability lemma and solution theorem for LQG controller .....	799
11.4.3	The controller Diophantine equations: solvability condition .....	810
11.4.4	LQG stochastic optimal control: an example .....	814
11.4.5	Minimum-variance control: a special LQG controller .....	817
11.4.6	The LQG stochastic optimal controller: $s$ -domain theorem .....	819
11.5.	The Wiener and Gradient Solutions to the LQG stochastic Optimal Control Problem .....	821
11.5.1	The Youla parameterization and the modern Wiener–Hopf solution procedures .....	822
11.5.2	The variational solution to the LQG stochastic optimal control problem .....	827
11.6.	The Polynomial Solution of the Deterministic Optimal LQ Control Problem .....	837
11.6.1	Deterministic control problem and solution .....	837
11.7.	Conclusions .....	839
11.8.	Problems .....	840
11.9.	References .....	842

## CHAPTER

12	OPTIMAL SELF-TUNING CONTROL SYSTEMS .....	845
12.1.	Introduction .....	845
12.1.1	A historical perspective .....	845
12.1.2	The general principles of optimal adaptive control .....	847
12.2.	Optimal Control Laws for Single-Input/Single-Output Systems .....	849
12.2.1	Discrete-time system models .....	851
12.2.2	Optimal performance criteria .....	853
12.2.3	Linear-quadratic-Gaussian optimal control laws .....	854
12.2.4	Observations weighted optimal control laws .....	861
12.2.5	Single-stage optimal control laws .....	864
12.3.	Parameter Estimation and Explicit Self-tuning Control .....	867
12.3.1	Desirable properties of estimators .....	867
12.3.2	Identifiability .....	869
12.3.3	Least-squares parameter estimation .....	871
12.3.4	Explicit self-tuning control and numerical aspects of estimation .....	873

12.4.	Implicit Self-tuning Control .....	877
12.4.1	Observations weighted controller .....	878
12.4.2	Weighted minimum-variance controller .....	881
12.4.3	PID self-tuning control .....	882
12.5.	Multivariable Self-tuning Control Systems .....	885
12.5.1	Multivariable minimum-variance regulators .....	886
12.5.2	Multivariable minimum-variance self-tuning regulators .....	888
12.5.3	Multivariable generalized minimum-variance controllers .....	890
12.5.4	Multivariable generalized minimum-variance self-tuning controllers .....	892
12.5.5	Multivariable observations weighted minimum variance controllers .....	893
12.5.6	Multivariable observations weighted self-tuning controller .....	901
12.5.7	Multivariable self-tuning regulators with pole assignment .....	905
12.6.	Conclusions .....	906
12.6.1	Engineering and implementational aspects .....	906
12.6.2	Concluding remarks .....	908
12.7.	Problems .....	909
12.8.	References .....	912

## CHAPTER

13	STOCHASTIC INDUSTRIAL CONTROL SYSTEMS .....	915
13.1.	Introduction .....	915
13.2.	The Design of Dynamic Ship-Positioning Systems .....	916
13.2.1	Dynamic ship-positioning systems: An introduction .....	916
13.2.2	Positioning system design requirements, and the limitations of classical design solutions .....	919
13.2.3	The thruster devices .....	924
13.2.4	The position-measurement systems .....	930
13.2.5	Equations of motion and disturbances .....	931
13.2.6	Linearized ship equations .....	934
13.2.7	Low-frequency motion estimator .....	936
13.2.8	High-frequency motion estimator .....	936
13.2.9	Combined Kalman and self-tuning filter scheme .....	939
13.2.10	Optimal controller design .....	941
13.2.11	Simulation of the dynamic ship-positioning system .....	943
13.3.	Estimation and Prediction for Ingot-Soaking Pits .....	954
13.3.1	The teeming to rolling cycle, and the soaking pit problem .....	955
13.3.2	Mathematical models for the soaking pit process .....	958
13.3.3	Models for soaking pit filters I: Least-square fits .....	961
13.3.4	Models for soaking pit filters II: A phenomenological approach .....	965
13.4.	Gauge-Control and Back-up Roll Eccentricity Problem .....	975
13.4.1	Rolling-mill gauge-control systems .....	975
13.4.2	The BISRA-Davy gauge-meter principle .....	976
13.4.3	The back-up roll eccentricity filtering problem .....	986
13.4.4	Control scheme philosophy .....	991
13.4.5	Kalman filtering solution for the control of gauge .....	992
13.4.6	Concluding comments .....	994
13.5.	References .....	995
