About the Editors xv
List of Contributors xvii

Chapter 1. Novel Micro/Nanoscale Configurations to Enhance Flow Boiling in Microchannels **1**

Fanghao Yang and Chen Li

1. Introduction 1
2. Experimental Study 2
   2.1. Experimental setup 3
   2.2. Testing procedure 4
   2.3. Uncertainty analysis 5
3. High Frequency Self-Sustained Two-Phase Oscillations 5
   3.1. Design of microchannel configurations 6
   3.2. Design of microdevices 8
   3.3. Fabrication of the microdevice 8
   3.4. Data reduction 10
   3.5. Mechanism 11
   3.6. Results and discussion 19
      3.6.1. Onset of nucleate boiling 19
      3.6.2. Enhanced two-phase heat transfer 19
      3.6.3. Comparisons between the present configuration and microchannels enhanced by reentrant cavities and IRs . . 21
      3.6.4. Two-phase flow oscillations 23
   3.7. Summary 24

4. Single Annular Flow in Microchannels 25
4.1. Design of nanostructured boiling surfaces 27
4.2. Design of microdevices 29
4.3. Microfabrications and SiNWs integration 29
4.4. Working mechanisms 32
4.5. Results and discussion 36
4.5.1. Average heat transfer coefficient 36
4.5.2. Local heat transfer coefficient 38
4.5.3. Heat transfer modes 39
4.5.4. Enhanced nucleate boiling 41
4.5.5. Promoted thin film evaporation and liquid renewal 43
4.5.6. The reduced pressure drop in SiNW microchannels 45
4.5.7. CHF and flow oscillations 48
4.6. Summary 49
References 50

Chapter 2. Evaporation, Dynamics and Interface Deformations in Thin Liquid Films Sheared by Gas in a Microchannel **57**

O.A. Kabov, V.V. Kuznetsov and Yu.O. Kabova

1. Introduction 57
2. Background 58
3. Equations, Initial and Boundary Conditions 61
4. Dimensionless Form of Equations 65
5. Numerical Algorithm and Validation 71
6. Results of Calculations and Discussion 82
6.1. Gas flow rate effect on vapor concentration and temperature distribution 82
6.2. Gas–liquid interface deformations 88
6.3. Heat transfer coefficient on the gas–liquid interphase (Biot number) 91
6.4. Evaporation rate and gravity effect 92
7. Conclusion 102
Nomenclature 104
Acknowledgments 105
References 106

Chapter 3. Boiling Heat Transfer Enhancement at the Microscale 109

Yoav Peles

1. Introduction 109
2. Enhancement Techniques — Definition and Classification 111
3. Reentrant Cavities 112
   - 3.1. Pool boiling with micro- and nanoscale reentrant cavities 115
   - 3.2. Flow boiling 118
4. Flow Boiling Instabilities — Methods to Mitigate in Microchannels . . 122
5. Pin Fins 124
   - 5.1. Flow patterns 125
   - 5.2. Pressure drop 127
   - 5.3. Void fraction 129
   - 5.4. Heat transfer coefficient 131

Acknowledgments 131
References 131

Chapter 4. Multi-Microchannel Evaporators: Flow Stabilization and Mapping for Safe Operation 137

Sylwia Szczukiewicz and John R. Thome

1. Introduction 137
2. State-of-the-Art of Two-Phase Flow Classification 139
3. Operating Regimes 142
   - 3.1. Simultaneous flow and temperature visualizations 142
   - 3.2. Flow patterns 146
   - 3.3. Thermal maps 152
   - 3.4. Heat transfer coefficient trends versus local flow behavior 155
4. Operational Maps 161
   - 4.1. Micro-orifice effect 163
   - 4.2. Influence of fluid properties 170
5. Summary 172

References 173

Chapter 5. Dynamic Modeling of On-Chip Two-Phase Cooling System with Multiple Micro-Evaporators in Parallel Flow 179

Nicolas Lamaison, Jackson B. Marcinichen and John R. Thome

1. Introduction 179
2. Literature Review 181

3. Simulation Code 183
3.1. Cooling system 183
3.1.1. Description of the loop 183
3.1.2. Scales of simulation 184
3.2. Assumptions and methodology 185
3.3. Semi-implicit solver 186
3.4. Flow model 187
3.5. Heat sink model 187
3.5.1. Momentum and energy balance 188
3.5.2. Fins equations 189
3.5.3. 2D conduction in the ME chip package 190
3.5.4. Inlet and outlet pressure drop 191
3.5.5. Subcooled boiling and CHF 191
3.5.6. Heat sink model flowchart 192
3.6. Multiple heat sink array cooling model 193
3.6.1. Piping 194
3.6.2. Mass flow distribution 195
3.6.3. Mixing vapor quality control 195
3.6.4. *Multiple heat sink array model* flowchart 196
3.7. Entire cooling system model 196
3.7.1. Auxiliary electronics (Post Heater) 196
3.7.2. Tube-in-tube condenser and micro-condenser 197
3.7.3. Liquid accumulator 198
3.7.4. Pressure control 200
3.7.5. Pump 201
3.7.6. *Entire cooling system model* flowchart 201
4. Code Validation with Experimental Tests 201
4.1. Geometry of the experimental facility 202
4.2. Steady state validation 203
4.3. Transient validation 204
5. Simulation Results 206
5.1. Dynamic heat sink behavior with row hot spots using the *heat sink model* 206
5.2. Sudden workload variation in parallel cooling setup using the *multiple heat sink array model* 212
5.3. Real blade simulation using the *entire cooling system model* . . . 216
5.3.1. Real blade cooling system geometry 216
5.3.2. Steady state results 216
5.3.3. Dynamic balanced/unbalanced workloads results 219
6. Conclusions 222

Appendix A. Summary of Correlations and Models 223
References 224

Chapter 6. Electronic Micro-Evaporator Cooling Systems and Flow Control 229

Jackson B. Marcinichen, Nicolas Lamaison and John R. Thome

1. Introduction 229
2. Cooling Cycles and Controllers 233
   2.1. Schematic of cooling cycles and instrument uncertainties 234
   2.2. Flow control 238
      2.2.1. Control strategies and structure 239
      2.2.2. Vapor quality (x_o), condensing pressure (P_{cond}) and approach temperature (ΔT_{cond}) controllers 241
      2.2.3. SISO–SIMO–SIMO integrated control strategy 241
   2.3. Disturbance rejection test 242
   2.4. Unbalanced heat loads test 243
3. Energy and Exergy Analysis 246
   3.1. Energy comparison — first law analysis 247
   3.2. Exergy comparison — second law analysis 248
4. Map of Performance 251
5. Conclusions and Remarks 255

References 256

Chapter 7. Dynamic Modeling of Compact Two-Phase Electronic Cooling Systems with Microchannel Evaporators 261

Tom Saenen and Martine Baelmans

1. Introduction 261
2. Two-Phase Flow Modeling 266
   2.1. Microchannel heat sink 266
   2.2. Compact two-phase cooling system 267
   2.3. Types of two-phase flow models 269
   2.4. Conservation equations 271
      2.4.1. Mass conservation 271
      2.4.2. Momentum conservation 272
      2.4.3. Energy conservation 272
      2.4.4. Implemented equations 273
3. Discretization of the Equations 274
   3.1. Temporal discretization 275

3.2. Spatial discretization 276
3.2.1. TVD schemes 278
3.3. Solution algorithms for pressure–velocity coupled equations . . . 280
3.4. Discretized flow equations 280
3.4.1. Momentum conservation 281
3.4.2. Mass conservation 282
3.4.3. Energy conservation 284
4. Closure Models and Empirical Correlations 285
5. Heat Conduction Model and Solution 289
6. Accumulator Model 293
7. The Complete Solution Algorithm 293
8. Code Verification 294
8.1. Method of manufactured solutions 295
9. Results 299
10. Summary and Conclusions 303
References 304
