Part 1. Hilbert's Fifth Problem

Chapter 1. Introduction 3
§1.1. Hilbert's fifth problem 7
§1.2. Approximate groups 14
§1.3. Gromov's theorem 20

Chapter 2. Lie groups, Lie algebras, and the Baker-Campbell-Hausdorff formula 25
§2.1. Local groups 26
§2.2. Some differential geometry 30
§2.3. The Lie algebra of a Lie group 34
§2.4. The exponential map 35
§2.5. The Baker-Campbell-Hausdorff formula 43

Chapter 3. Building Lie structure from representations and metrics 53
§3.1. The theorems of Cartan and von Neumann 57
§3.2. Locally compact vector spaces 60
§3.3. From Gleason metrics to Lie groups 64

Chapter 4. Haar measure, the Peter-Weyl theorem, and compact or abelian groups 73

Tao, Terence
Hilbert's fifth problem and related topics
digitalisiert durch:
IDS Basel Bern

§4.1. Haar measure 76
§4.2. The Peter-Weyl theorem 87
§4.3. The structure of locally compact abelian groups 94

Chapter 5. Building metrics on groups, and the Gleason-Yamabe theorem 99
§5.1. Warmup: the Birkhoff-Kakutani theorem 101
§5.2. Obtaining the commutator estimate via convolution 103
§5.3. Building metrics on NSS groups 106
§5.4. NSS from subgroup trapping 112
§5.5. The subgroup trapping property 114
§5.6. The local group case 117

Chapter 6. The structure of locally compact groups 125
§6.1. Van Dantzig's theorem 127
§6.2. The invariance of domain theorem 131
§6.3. Hilbert's fifth problem 133
§6.4. Transitive actions 136

Chapter 7. Ultraproducts as a bridge between hard analysis and soft analysis 139
§7.1. Ultrafilters 144
§7.2. Ultrapowers and ultralimits 148
§7.3. Nonstandard finite sets and nonstandard finite sums 157
§7.4. Asymptotic notation 158
§7.5. Ultra approximate groups 161

Chapter 8. Models of ultra approximate groups 167
§8.1. Ultralimits of metric spaces (Optional) 169
§8.2. Sanders-Croot-Sisask theory 176
§8.3. Locally compact models of ultra approximate groups 184
§8.4. Lie models of ultra approximate groups 190

Chapter 9. The microscopic structure of approximate groups 197
§9.1. Gleason's lemma 204
§9.2. A cheap version of the structure theorem 208
§9.3. Local groups 212

Chapter 10. Applications of the structural theory of approximate groups 219

§10.1. Sets of bounded doubling 220
§10.2. Polynomial growth 223
§10.3. Fundamental groups of compact manifolds (optional) 225
§10.4. A Margulis-type lemma 229

Part 2. Related Articles

Chapter 11. The Jordan-Schur theorem 233
§11.1. Proofs 234

Chapter 12. Nilpotent groups and nilprogressions 237
§12.1. Some elementary group theory 239
§12.2. Nilprogressions 244

Chapter 13. Ado's theorem 249
§13.1. The nilpotent case 252
§13.2. The solvable case 254
§13.3. The general case 258

Chapter 14. Associativity of the Baker-Campbell-Hausdorff-Dynkin law 259

Chapter 15. Local groups 265
§15.1. Lie's third theorem 269
§15.2. Globalising a local group 270
§15.3. A nonglobalisable group 274

Chapter 16. Central extensions of Lie groups, and cocycle averaging 277
§16.1. A little group cohomology 279
§16.2. Proof of theorem 285

Chapter 17. The Hilbert-Smith conjecture 289
§17.1. Periodic actions of prime order 290
§17.2. Reduction to the p-adic case 293

Chapter 18. The Peter-Weyl theorem and nonabelian Fourier analysis 297
§18.1. Proof of the Peter-Weyl theorem 298
§18.2. Nonabelian Fourier analysis 302

Chapter 19. Polynomial bounds via nonstandard analysis 307

Chapter 20. Loeb measure and the triangle removal lemma 313

§20.1. Loeb measure 316
§20.2. The triangle removal lemma 321

Chapter 21. Two notes on Lie groups 325

Bibliography 329
