Abstract	VII
1 Introduction	1
1.1 Results of this thesis	3
1.2 Thesis overview	6
I Theoretical foundations	9
2 Problem formulation	11
2.1 Dynamical models described by Partial Differential Equations . . .	11
2.2 Coupled ODEs and PDEs	15
2.3 The Optimal Control Problem	15
3 Direct Optimization: Problem discretization	19
3.1 Discretize-then-optimize approach	19
3.2 Method Of Lines: Discretization in space	20
3.3 Direct Multiple Shooting: Discretization in time	23
3.4 Discretization of path constraints	25
3.5 The resulting Nonlinear Programming Problem	25
4 Elements of optimization theory	27
4.1 Basic definitions	27
4.2 Necessary optimality conditions	28
II Numerical methods	31
5 Inexact Sequential Quadratic Programming	33
5.1 Newton-type methods	33
5.2 Local convergence	36

5.3	Globalization of convergence	38
5.3.1	Generalized level functions	39
5.3.2	The Newton path	40
5.3.3	The natural level function and the Natural Monotonicity Test	41
5.4	A Rosenbrock-type example	45
5.5	The Restrictive Monotonicity Test	46
5.6	Natural Monotonicity for LISA-Newton methods	46
5.6.1	Estimates for natural monotonicity	47
5.6.2	A Linear Iterative Splitting Approach	54
5.6.3	GINKO Algorithm	67
5.7	Inequality constrained optimization problems	68
5.7.1	SQP with exact derivatives	68
5.7.2	Inexact SQP	72
6	Newton-Picard preconditioners	75
6.1	The Newton-Picard method for finding periodic steady states	76
6.2	Discretization of the model problem	77
6.3	Newton-Picard for optimal control problems	80
6.3.1	General considerations	81
6.3.2	Simultaneous Newton-Picard iteration	81
6.3.3	Convergence for classical Newton-Picard	85
6.3.4	Numerical solution of the approximated linear system	90
6.3.5	Pseudocode	91
6.3.6	Algorithmic complexity	95
6.4	Extension to nonlinear problems and Multiple Shooting	97
7	One-shot one-step methods and their limitations	99
7.1	Illustrative, counter-intuitive examples in low dimensions	101
7.1.1	Fast forward convergence, optimization divergence	102
7.1.2	Forward divergence, fast optimization convergence	102
7.2	Subproblem regularization	103
7.3	Analysis of the regularized subproblems	104
7.3.1	Primal regularization	105
7.3.2	Primal-dual regularization	106
7.3.3	Hemi-primal regularization	107
7.3.4	Divergence and de facto loss of convergence for subproblem regularizations	109
8	Condensing	111

8.1	Multiple shooting structure	111
8.2	Newton-Picard structure	115
8.3	Elimination of discretized PDE states	118
8.4	Newton-Picard Hessian approximation	120
8.5	Scaling invariance of the Newton-Picard LISA-Newton method	121
9	A Parametric Active Set method for QP solution	123
9.1	General remarks on Quadratic Programming Problems	123
9.1.1	Optimality conditions	124
9.1.2	Existing methods	124
9.1.3	Existing software	125
9.2	Parametric Active Set methods	127
9.2.1	The Parametric QP	127
9.2.2	The Parametric Quadratic Programming algorithm	127
9.2.3	Far bounds	132
9.3	Fundamental numerical challenges	133
9.4	Strategies to meet numerical challenges	134
9.4.1	Rounding errors and ill-conditioning	134
9.4.2	Comparison with zero	136
9.4.3	Cycling and ties	137
9.5	The code rpsasm: A PASM in Matlab®	139
9.6	Comparison with existing software	139
9.6.1	Criteria for comparison	139
9.6.2	Discussion of numerical results	140
9.7	Drawbacks of the proposed PASM	142
9.8	Nonconvex Quadratic Programs	143
10	Automatic derivative generation	145
10.1	Algorithmic Differentiation	146
10.2	The principle of IND	147
10.3	IND for implicit time-stepping with monitor strategy	148
10.4	Numerical effort of IND	151
11	The software package MUSCOP	153
11.1	Programming paradigms	153
11.1.1	Hybrid language programming	153
11.1.2	No data encapsulation	154
11.1.3	Algorithm centered not model centered	155
11.1.4	Reverse Communication interface	155

11.2	Orchestration of software components	157
11.2.1	Function and derivative evaluation	157
11.2.2	Condensing and condensed QP solution	158
11.2.3	Estimation of κ and ω	159
11.2.4	Automatic mesh refinement	159
III Applications and numerical results		161
12	Linear boundary control for the periodic 2D heat equation	163
12.1	General parameters	163
12.2	Euclidean vs. L^2 projector	164
12.3	Mesh independence	167
12.4	Comparison with Schur complement preconditioning	169
13	Nonlinear boundary control of the periodic 1D heat equation	171
13.1	Problem and algorithmical parameters	171
13.2	Discussion of numerical convergence	172
13.2.1	Grid refinements	172
13.2.2	Computation times	174
13.2.3	Exact Hessian vs. two-grid approximation	175
13.2.4	Refinement of control in time	177
14	Optimal control for a bacterial chemotaxis system	181
14.1	Problem formulation	181
14.2	Numerical results	182
15	Optimal control of a Simulated Moving Bed process	187
15.1	Mathematical modeling of adsorption processes	188
15.1.1	General Rate Model	188
15.1.2	Mass balances	191
15.1.3	Objective and constraints	192
15.2	Numerical results	192
16	Conclusions and future work	199
	Bibliography	201
