

Contents

1	Variable space and subject space	1
2	Some vector geometry	9
2.1	Elementary operations on vectors	9
2.2	Variables and vectors	18
2.3	Vector spaces	21
2.4	Linear dependence and independence	24
2.5	Projection onto subspaces	25
3	Bivariate regression	32
3.1	Selecting the regression vector	32
3.2	Measuring goodness of fit	35
3.3	Means and the regression intercept	37
3.4	The difference between two means	40
4	Multiple regression	44
4.1	The geometry of prediction	44
4.2	Measuring goodness of fit	48
4.3	Interpreting a regression vector	51
5	Configurations of regression vectors	58
5.1	Linearly dependent predictors	58
5.2	Nearly multicollinear predictors	62
5.3	Orthogonal predictors	66
5.4	Suppressor variables	69
6	Statistical tests	72
6.1	The effect space and the error space	72
6.2	The population regression model	76
6.3	Testing the regression effects	78
6.4	Parameter restrictions	85

7	Conditional relationships	90
7.1	Partial correlation	90
7.2	Conditional effects in multiple regression	94
7.3	Statistical tests of conditional effects	98
8	The analysis of variance	105
8.1	Representing group differences	105
8.2	Unequal sample sizes	111
8.3	Factorial designs	115
8.4	The analysis of covariance	119
9	Principal-component analysis	127
9.1	Principal-component vectors	127
9.2	Variable-space representation	133
9.3	Simplifying the variables	134
9.4	Factor analysis	137
10	Canonical correlation	144
10.1	Angular relationships between spaces	144
10.2	The sequence of canonical triplets	148
10.3	Test statistics	151
10.4	The multivariate analysis of variance	155
