

TABLE DES MATIÈRES

James Simons & Dennis Sullivan — <i>Structured bundles define differential K-theory</i>	1
References	3
Nigel Hitchin — <i>Einstein metrics and magnetic monopoles</i>	5
1. Introduction	5
2. Euclidean monopoles	6
2.1. Twistor spaces	9
3. Hyperbolic monopoles	11
3.1. Centres	12
3.2. Rational normal curves	14
4. Charge 2 hyperbolic monopoles	16
4.1. SU(2) monopoles	16
4.2. Orbifold twistor spaces	18
4.3. The contact form	20
4.4. SU(3) monopoles	21
4.5. Axially symmetric monopoles	23
5. New metrics for old	26
References	28
Kefeng Liu, Xiaofeng Sun & Shing-Tung Yau — <i>Geometry of Moduli Spaces</i>	31
1. Introduction	31
2. Fundamentals of Teichmüller and Moduli Spaces	32
3. Canonical Metrics on \mathcal{M}_g	36
4. Notions of Goodness	39
5. The Monge-Ampère Equation and the Goodness	43
6. Rigidity and Gauss-Bonnet Theorem	46

References	49
Robert L. Bryant — Gradient Kähler Ricci Solitons	51
1. Introduction and Summary	51
1.1. Basic facts	52
1.1.1. The associated holomorphic vector field Z	52
1.1.2. The holomorphic volume form Υ	52
1.1.3. The Υ -divergence of Z	52
1.2. Generality	53
1.2.1. Nonsingular extension	53
1.2.2. Singular existence	53
1.3. The positive case	54
1.4. The toric case	55
1.5. Acknowledgement	56
2. Associated Holomorphic Quantities	56
2.1. Preliminaries	56
2.1.1. Tensors and inner products	56
2.1.2. Coordinate expressions and the Ricci form	57
2.1.3. The gradient Kähler Ricci soliton condition	58
2.2. The associated holomorphic volume form	58
2.2.1. Existence of special coordinates	58
2.3. The holomorphic flow	59
2.3.1. The infinitesimal symmetry	60
2.3.2. Z in special coordinates	60
2.3.3. The Υ -divergence of Z	61
2.4. Examples	62
3. Potentials and local generality	65
3.1. Local potentials	66
3.2. Nonsingular extension problems	66
3.2.1. Local reduction to equations	66
3.3. Near singular points of Z	69
3.3.1. Linear parts and linearizability	69
3.3.2. Prescribed eigenvalues	73
3.3.3. Normalizing volume forms	73
3.3.4. Local solitons near a singular point	74
3.3.5. A boundary value formulation	75
4. Poincaré coordinates in the positive case	76
4.1. First consequences	76
4.2. Poincaré coordinates	80

4.3. Coordinate ambiguities	81
4.4. Global consequences	83
4.4.1. Periodic orbits	83
4.4.2. An invariant potential	83
4.4.3. Normalized linearizing coordinates	84
4.4.4. Totally geodesic submanifolds	85
4.4.5. Growth of f in linearizing coordinates	86
5. The toric case	90
5.1. Symmetry reduction in the toric case	90
5.1.1. A singular initial value problem	92
5.1.2. A Lagrangian formulation	95
References	96

Denis Auroux — *Special Lagrangian fibrations, mirror symmetry and Calabi-Yau double covers* 99

1. Introduction	100
Acknowledgements	101
2. The SYZ conjecture and mirror symmetry	102
2.1. Motivation	102
2.2. Special Lagrangian fibrations and T-duality	103
2.3. Mirror symmetry for Calabi-Yau manifolds	105
2.4. Mirror symmetry in the complement of an anticanonical divisor	107
3. Special Lagrangian fibrations and double covers	114
3.1. Special Lagrangians and Calabi-Yau double covers	114
3.2. Example: $\mathbb{C}P^1$ and elliptic curves	116
3.3. Example: Elliptic surfaces	118
3.4. Example: $\mathbb{C}P^2$ and K3	120
3.5. Towards mirror symmetry for double covers	122
References	126

Jeff Cheeger & Bruce Kleiner — *Characterization of the Radon-Nikodym Property in terms of inverse limits* 129

1. Introduction	129
Relation with previous work	130
Applications to metric measure spaces	131
Acknowledgement	131
2. Inverse systems	131
3. The proof of Theorem 1.4	134
4. A variant of the Determining Property	135

5. GFDA versus ANP	137
References	137
Xiuxiong Chen & Yudong Tang — <i>Test configuration and geodesic rays</i>	139
1. Introduction	139
Acknowledgments	143
2. Preliminary	143
2.1. Geodesic rays in Kähler potential space	143
2.2. Test configuration and equivariant embedding	145
3. Relative $C^{1,1}$ geodesic ray from smooth test configuration	146
3.1. Existence	146
3.2. Special cases: geodesic line and Toric variety	148
4. Connection between algebraic notions and geometric notions	149
4.1. Algebraic ray and geodesic ray	149
4.2. Bounded ambient geometry and test configuration	151
4.3. Futaki invariant, Υ invariant and geodesic stability	151
5. Monge-Ampère equation on Simple test configurations	154
5.1. Construction of $\mathcal{W} \rightarrow \mathcal{M}$	154
5.2. One side of the Correspondence	156
5.3. The other side of the correspondence	156
6. Openness of super regular solution	159
7. Geodesic ray from Toric degenerations	161
7.1. Basics of Toric degeneration	161
Example	162
7.2. Explicit calculation of the $C^{1,1}$ geodesic ray	162
References	166
Rafe Mazzeo — <i>Flexibility of singular Einstein metrics</i>	169
1. Introduction	169
2. Iterated cone-edge spaces	173
3. Surfaces with conic singularities	174
4. Conifolds in dimension 3	178
5. Higher dimensions and codimensions	182
6. Methods	185
6.1. The Einstein equation and Bianchi gauge	185
6.2. Conic and edge operators	187
References	191

Piotr T. Chruściel & João Lopes Costa — <i>On uniqueness of stationary vacuum black holes</i>	195
1. Introduction	195
1.1. Static case	198
2. Preliminaries	200
2.1. Asymptotically flat stationary metrics	200
2.2. Domains of outer communications, event horizons	201
2.3. Killing horizons, bifurcate horizons	202
2.3.1. Near-horizon geometry	203
2.4. Globally hyperbolic asymptotically flat domains of outer communications are simply connected	204
3. Zeros of Killing vectors	205
4. Horizons and domains of outer communications in regular space-times ..	208
4.1. Sections of horizons	208
4.2. The structure of the domain of outer communications	213
4.3. Smoothness of event horizons	220
4.4. Event horizons vs Killing horizons in analytic vacuum space-times ..	221
5. Stationary axisymmetric black hole space-times: the area function	223
5.1. Integrability	224
5.2. The area function for a class of space-times with a commutative group of isometries	225
5.3. The ergoset in space-time dimension four	239
6. The reduction to a harmonic map problem	242
6.1. The orbit space in space-time dimension four	242
6.2. Global coordinates on the orbit space	243
6.3. All horizons non-degenerate	244
6.4. Global coordinates on $\langle\langle \mathcal{M}_{\text{ext}} \rangle\rangle$	247
6.5. Boundary conditions at non-degenerate horizons	248
6.5.1. The Ernst potential	250
6.6. The harmonic map problem: existence and uniqueness	255
6.7. Candidate solutions	256
7. Proof of Theorem 1.3	257
7.1. Rotating horizons	257
7.2. Non-rotating case	258
8. Concluding remarks	259
Acknowledgements	260
