CONTENTS

1 Introduction 1
- 1.1 Examples of implicit descriptions 1
- 1.2 Formal proofs and cut elimination 4
- 1.3 Feasibility 5
- 1.4 Combinatorial models 7
- 1.5 Formal proofs and algorithmic complexity 8
- 1.6 The role of symmetry 9
- 1.7 Partial symmetries 9
- 1.8 Computational complexity 10

2 Morphisms in logic and complexity 15
- 2.1 Morphisms and formal proofs 15
- 2.2 Morphisms and monotonicity 16
- 2.3 Combinatorial "proof systems" 17

3 Exponential processes and formal proofs 19
- 3.1 Preliminaries 19
- 3.2 A process of branching 22
- 3.3 A stronger process of branching 24
- 3.4 Comparisons 28
- 3.5 The pigeon-hole principle 29
- 3.6 Proofs, sets, and cells 30

4 Graphs and their visibilities 37
- 4.1 Optical graphs 37
- 4.2 The definition of the "visibility" 38
- 4.3 Some examples 39
- 4.4 Visibility and depth 43
- 4.5 The canonical projection 45
- 4.6 Basic properties of the visibility 46
- 4.7 The size of the visibility 48
- 4.8 Formal proofs and logical flow graphs 50
- 4.9 Comparison with L-systems 53
- 4.10 "Visibility" in Riemannian manifolds 56
- 4.11 Universal covering spaces 65
- 4.12 Boolean circuits and expressions 76
- 4.13 Combinatorial dynamical systems 81
- 4.14 Exponential expansion 84

5 Asymptotic growth of infinite visibilities 88
5.1 Introduction 88
5.2 When loops meet 89
5.3 When loops do not meet 91
5.4 Summary and remarks 104
5.5 Asymptotic geometry 105

6 Geometric aspects of cut elimination 109
6.1 Preliminary remarks 109
6.2 The process of cut elimination 111
6.3 A first scenario, and the breaking of cycles 114
6.4 A second scenario, and the breaking of focal pairs 115
6.5 A third scenario, and chains of focal pairs 115
6.6 The third scenario, continued 120
6.7 Chains of focal pairs in the second scenario 121
6.8 Recapitulation 122
6.9 Proofs without focal pairs 124
6.10 A fourth scenario, and the creation of focal pairs 125
6.11 Extensions of chains of focal pairs 125
6.12 Steady graphs and cut-free proofs 126
6.13 Steady graphs with oriented cycles 132
6.14 Steady horizons 133
6.15 A simplified model 136
6.16 Comparisons 139
6.17 A brief digression 140
6.18 Proofs with simple cuts 143

7 Feasibility graphs 155
7.1 Basic concepts 155
7.2 Extensions and comparisons 159
7.3 Some remarks about computability 161
7.4 Feasibility and visibility graphs 162
7.5 Upper bounds 164
7.6 Concrete examples 165
7.7 Measurements of complexity in groups 168
7.8 Trivial words in groups 170
7.9 Examples about numbers 175
7.10 Trees 176
7.11 Boolean circuits 177
7.12 Homomorphisms and comparisons 178

8 Bounds for finite visibilities 180
8.1 The propagator rule 180
8.2 Visibilities within visibilities 183
8.3 The Calderón–Zygmund decomposition 185

8.4 The Corona decomposition 188
8.5 The derived graph 191
8.6 Extensions 192
8.7 A more direct counting argument 195
8.8 Exponential bounds for general graphs 200
8.9 The restrained visibility 207
8.10 Graphs with cycles 210

9 Some related computational questions 212
9.1 The size of the visibility 212
9.2 The visibility recognition problem 216
9.3 An implicit version 220
9.4 The visibility isomorphism problem 221
9.5 Computations with implicit descriptions 228

10 Mappings and graphs 231
10.1 Mappings and weak mappings 231
10.2 Computational questions 235
10.3 Local +-isomorphisms 236
10.4 Some interpretations 242
10.5 The local +-injection problem 243
10.6 A uniqueness result 247
10.7 Minimal representations 248
10.8 Mappings and effective witnesses 252
10.9 The visibility isomorphism problem 253
10.10 Minimal representations and DP 257
10.11 Minimal folding graphs 258
10.12 Universal constructions 262
10.13 The visibility spectrum 266
10.14 The local +-isomorphism problem 271
10.15 Comparisons with k-provability 275
10.16 A partial ordering between graphs 276
10.17 Monotonicity properties 278
10.18 Possible behavior of mappings 279
10.19 Possible behavior of mappings, continued 282

11 Mappings and comparisons 285
11.1 Locally +-stable mappings 285
11.2 Locally +-uniform mappings 287
11.3 Mappings and symmetry 288
11.4 Labelled graphs 289
11.5 Feasibility graphs 290

12 Adjacency matrices and counting 294
12.1 The adjacency matrix 294
12.2 Counting in the visibility 295

12.3 Some concrete examples 299
12.4 Representation problems 310
12.5 Mappings and matrices 311

13 Duality and NP-completeness 313
13.1 The visibility mapping problem 313
13.2 Monotonicity and stability properties 317
13.3 The visibility surjection problem 319
13.4 The visibility injection problem 324

14 Finite automata and regular languages 327
14.1 Definitions and the subset construction 327
14.2 Geometric reformulations 332
14.3 An extended view 334
14.4 Markov languages 335

15 Constructions with graphs 338
15.1 Mappings and automata 338
15.2 Cartesian products and concatenation 339
15.3 Free products and positive closure 342
15.4 Unions and intersections 343
15.5 Fiber products (in general) 345
15.6 Fiber products of graphs 348
15.7 Interpretations for automata 352

16 Stronger forms of recursion 355
16.1 Feasible numbers 356
16.2 Combinatorial interpretations 358
16.3 Feasibility graphs for feasibility graphs 361
16.4 Correspondence with functions 369
16.5 Implicit representations of functions 372
16.6 Functions and points 373
16.7 Graphs and numbers 375
16.8 Graphs and numbers, continued 378
16.9 Rings and semirings 381
16.10 Feasibility of sets 384
16.11 Visual interpretations 389
16.12 Codings and sets 390
16.13 Other operations 392
16.14 Simulations and conversions 395
16.15 Sums and visibility graphs 397
16.16 Back to formal proofs 399

17 Groups and graphs 404
17.1 Cayley graphs and the word metric 404
17.2 Pause for some definitions 406

17.3 The Heisenberg groups 408
17.4 Geometry of Heisenberg groups 413
17.5 Automatic groups 418
17.6 Automatic structures for graphs 420
17.7 Between Cayley graphs and graphs in general 430
17.8 Scales and paths 430
17.9 Connections between scales and paths 431
17.10 The k-fellow traveller property 434

18 Extended notions of automata 436
18.1 Asynchronous automata 437
18.2 Heisenberg groups 440
18.3 Expanding automata 441
18.4 Tapes that cross 445

19 Geometry of scales in metric spaces 449
19.1 Metric spaces and length spaces 449
19.2 Discretizations of metric spaces 451
19.3 The scale–geometry graph 456
19.4 Conditions of bounded geometry 458
19.5 Automatic structures 460
19.6 Making choices 461
19.7 A geometric caveat 463
19.8 The doubling condition 464

20 The Corona decomposition revisited 465
20.1 Interesting paths 465
20.2 Reduced graphs 467
20.3 Crisp paths 470
20.4 A weak mapping between visibilities 473
20.5 Injectivity properties of the weak mapping 476
20.6 Bounds 477

Appendix

A Formal proofs: A brief review 480
A.1 Sequent calculus 480
A.2 Cut elimination 483
A.3 The logical flow graph 484
