Symbols xix

1 **Introduction** 1
1.1 Observations 1
1.1.1 Microscopic and macroscopic properties of solids 1
1.1.2 Physical characteristics of crystals 1
1.1.3 Physical properties of crystals 2
1.1.4 Thermodynamic properties of crystals 8
1.1.5 So what do some simple observations tell us? 10
1.2 Length scales and time scales 12
1.3 Tools of the trade 13
1.3.1 Theoretical and mathematical tools 13
1.3.2 Experimental tools 15
1.3.3 Special tools and concepts for the study of the structure and dynamics of crystals 16
Summary of chapter 17
Further reading for Chapter 1 17

2 **Structure of materials** 18
2.1 Introduction 18
2.2 Crystal structures of the elements 19
2.2.1 Close-packed metals 19
2.2.2 Body-centred cubic packing 25
2.2.3 Simple cubic packing 25
2.2.4 Crystal structures of elements with covalent bonding 26
2.2.5 Diatomic molecular structures and other molecular elements 27
2.2.6 Summary of the structures of the elements 29
2.3 Crystal structures of some simple inorganic compounds 29
2.3.1 Diatomic compounds 29
2.3.2 Ionic packing 31
2.3.3 Crystals with general formula AX_m, and the general idea of coordination polyhedra 32
2.4 The perovskite family of crystal structures 35
2.4.1 The ideal perovskite structure 35
2.4.2 Ferroelectric phase transitions in perovskites 37
2.4.3 Rotational phase transitions 38
2.4.4 Effects of chemical variation 39
2.4.5 Variations on the perovskite theme 40

2.5 Organic crystals 40
2.6 Disordered materials 41
2.6.1 The importance of structural disorder 41
2.6.2 Orientational disorder in molecular crystals 41
2.6.3 Orientational disorder in framework structures 42
2.6.4 Fast-ion conductors 43
2.6.5 Liquid crystals 43
2.7 Glasses and amorphous phases 44
2.7.1 Glasses and structural disorder 44
2.7.2 Quantifying short-range order 45
2.7.3 Amorphous and crystalline phases of silica 47
2.8 Conclusions 48
Summary of chapter 49
Further reading 50
Exercises 50

3 Formal description of crystal structures 52
3.1 Introduction 52
3.2 Crystal structure: lattices, unit cell, and atomic coordinates 53
3.2.1 Definition of the crystal lattice 53
3.2.2 The unit cell 54
3.2.3 Lattices, lattice parameters, and symmetry: the seven crystal systems 54
3.2.4 Volume of the unit cell 56
3.2.5 Conventional and primitive lattices: The 14 Bravais lattices 56
3.2.6 Atomic coordinates 57
3.2.7 Crystal structure as the convolution of the lattice and the atomic basis 58
3.3 Crystal symmetry 1. Point-symmetry operations 61
3.3.1 Point symmetry 61
3.3.2 The four point symmetry operations 61
3.3.3 Combination of symmetry operations 64
3.3.4 The 32 crystallographic point groups 65
3.4 Application of the formalism of point groups 66
3.4.1 Symmetry of the crystal 66
3.4.2 Symmetry breaking transformations 68
3.5 Crystal symmetry 2. Translational symmetry and space groups 70
3.5.1 Translational symmetry 70
3.5.2 Enumeration of the space groups 72
3.6 Breaking the rules: aperiodic structures, incommensurate materials, and quasicrystals 73
3.6.1 Incommensurate or modulated structures 73
3.6.2 Quasicrystals 74
Summary of chapter 74
Further reading 75
Exercises

4 The reciprocal lattice 78
4.1 The concept of the reciprocal lattice 78
4.2 *Definitions* 79
4.2.1 Geometry of the reciprocal lattice and its link to the crystal lattice 80
4.2.2 Relationship between real and reciprocal lattice parameters 81
4.2.3 Interplanar spacing and the reciprocal lattice parameters 82
4.2.4 Reciprocal lattice vectors and atomic structure 82
4.3 Non-primitive lattices 82
4.3.1 Some general principles and practical methods 82
4.3.2 Primitive and non-primitive lattices: application to bcc and fcc lattices 85
4.4 The reciprocal lattice as the Fourier transform of the crystal lattice 86
4.5 Reciprocal space and the Brillouin zone 87
Summary of chapter 89
Further reading 90
Exercises 90

5 Atomic bonding in crystals 91
5.1 Bonding and the variety of crystal structures 91
5.2 Thermodynamic preamble: the context of the binding energy 91
5.3 Lattice energy 94
5.4 Models of bonding 96
5.4.1 Coulomb energy 96
5.4.2 Repulsive interactions 98
5.4.3 Combination of Coulomb and Born–Mayer interactions: example of alkali halides 98
5.4.4 Dispersive interactions: binding in molecular crystals 99
5.4.5 Shell models 100
5.4.6 Hydrogen bonds 101
5.4.7 Empirical representations of covalent and metallic bonding 102
5.5 Quantum mechanical view of chemical bonding 105
5.5.1 The need to take a proper quantum-mechanical view 105
5.5.2 Born–Oppenheimer approximation 106
5.5.3 Bloch's theorem for electrons in a periodic structure 106
5.5.4 Simple view of bonding in molecules 107
5.5.5 Tight-binding methods 108
5.5.6 Electron–electron interactions: Hartree–Fock and beyond 110
5.5.7 Representation of electronic wave functions 112
5.5.8 Practical calculations of binding energies from quantum mechanics 114
Summary of chapter 114
Further reading 115
Exercises 115

6 Diffraction 117
6.1 Basics of diffraction 117
6.1.1 Use of radiation beams 117
6.1.2 Bragg's law 118
6.1.3 Single-crystal and powder diffraction measurements 118
6.1.4 Diffraction and crystal structures 119
6.2 Beams of radiation and measurement of diffraction patterns 119
6.2.1 Laboratory X-ray methods 119
6.2.2 Measurement of the intensity of scattered X-ray beams 120
6.2.3 Synchrotron X-ray sources 122
6.2.4 Neutron beams 123
6.2.5 Comparison of the characteristics of X-ray and neutron beams 126
6.2.6 Beams of electrons 129
6.3 Basics of the theory of diffraction 129
6.3.1 The wave equation 129
6.3.2 Scattering of radiation from two particles 130
6.3.3 Scattering of radiation from a collection of particles 132
6.4 Scattering of radiation from a continuous distribution of particles 133
6.4.1 General principle 133
6.4.2 X-ray atomic scattering factor 133
6.4.3 Neutron scattering factors 134
6.5 Diffraction and Fourier analysis 134
6.5.1 Scattering processes as Fourier transforms 134
6.5.2 Fourier transforms and convolution 135
6.6 Application: the structure of glasses revealed by neutron scattering 136
6.7 Diffraction from crystalline materials 138
6.7.1 Fourier transform of the perfect crystal 138
6.7.2 The effect of particle size on the diffraction pattern 140
6.7.3 The inverse transform: obtaining the electron density from X-ray diffraction measurements of the structure factor 140
6.7.4 The phase problem 141
6.8 Effects of symmetry on diffraction patterns 142
6.8.1 Friedel's law 142
6.8.2 Point symmetry of diffraction patterns 144
6.8.3 Centre of symmetry 145
6.8.4 Systematic absences 145
6.8.5 Determination of space-group symmetry 147
6.9 Solution of the phase problem and determination of crystal structure 149
6.9.1 The origin of the phase problem 149
6.9.2 Historical review of attempts to bypass the phase problem 149
6.9.3 Direct methods to overcome the phase problem 150
6.9.4 Refinement of the crystal structure 151

Summary of chapter 152
Further reading 153
Exercises 154

Physical properties 156
7.1 Overview 156
7.1.1 Crystal anisotropy 156
7.1.2 An introduction to tensors 157
7.1.3 Field and matter tensors 158
7.2 First-rank tensors 158
7.3 Second-rank tensors 158
7.3.1 Basic ideas 158
7.3.2 Stress as a second-rank tensor 160
7.3.3 Strain as a second-rank tensor 160
7.3.4 45° rotation of the strain tensor and the conversion between tensile and shear strain 161
7.3.5 Voigt notation 162
7.3.6 Principal axes 163
7.3.7 Symmetry and second-rank matter tensors 164
7.3.8 Example of zero thermal expansion 164
7.4 Third-rank tensors 165
7.4.1 Piezoelectricity 165
7.4.2 Use of Voigt notation for third-rank tensors 169
7.4.3 Transformations of third-rank tensors 169
7.5 Fourth-rank tensors 171
7.5.1 A hierachy of higher-order tensors 171
7.5.2 The elasticity tensors 171
7.6 Induced changes in matter tensors 172
7.6.1 Basic ideas 172
7.6.2 Refractive index, the electro-optic effect, and the photoelastic effect 172
Summary of chapter 173
Further reading 173
Exercises 173

8 Lattice dynamics 175
8.1 Why do we need to consider dynamics? 175
8.2 The harmonic approximation 175
8.3 Lattice vibrations of one-dimensional monatomic crystals 176
8.3.1 The linear chain model 176
8.3.2 Sound waves – vibrations with long wavelengths 177
8.3.3 Vibrations with shorter wavelengths: general features 178
8.3.4 Vibrations with shorter wavelengths: the special case of $\lambda = 2a$ 178
8.3.5 Vibrations with shorter wavelengths: the general case 179
8.3.6 Extension of model of monatomic chain to include distant neighbours 180
8.3.7 Reciprocal lattice, the Brillouin zone, and allowed wave vectors 181

8.3.8 *Three-dimensional monatomic crystals: general principles* 182
8.4 Dispersion curves in face-centred cubic materials 183
8.4.1 Dispersion curves of neon 183
8.4.2 Dispersion curves of lead 187
8.4.3 Dispersion curves of potassium 187
8.5 Lattice vibrations of crystals with several atoms in the unit cell 189
8.5.1 The basic model 189
8.5.2 Solution for small wave vector 190
8.5.3 General result 192
8.5.4 Generalization for more complex cases: atomic motions 193
8.5.5 Generalization for more complex cases: the dynamical matrix 194
8.5.6 Lattice dynamics of ionic crystals 196
8.5.7 The lattice dynamics of the alkali halides 197
8.5.8 The lattice dynamics of quartz 198
Summary of chapter 199
Further reading 200
Exercises 200

9 Thermodynamics and lattice dynamics 202
9.1 The quantization of lattice vibrations 202
9.1.1 Phonons: the quanta of harmonic lattice vibrations 202
9.1.2 The Bose–Einstein relation, $n(\omega, T)$ 203
9.1.3 High-temperature behaviour 204
9.1.4 Heat capacity 204
9.1.5 Phonon free energy and entropy 205
9.2 Thermodynamic functions for crystals 206
9.2.1 Thermodynamic functions 206
9.2.2 The Einstein model 206
9.2.3 Density of states 207
9.2.4 Density of states for acoustic modes 207
9.2.5 Debye model of heat capacity 208
9.2.6 Example of thermodynamic functions of fluorite, CaF_2 209
9.3 Atomic displacements 211
9.3.1 Normal mode coordinates 211
9.3.2 Vibrational energy and amplitude 211
9.3.3 Recasting the crystal Hamiltonian 212
Summary of chapter 213
Further reading 214
Exercises 214

10 Experimental methods for measurements of vibrational frequencies 216
10.1 Introduction 216
10.2 Basic ideas of spectroscopy 217
10.3 Neutron scattering techniques 219
10.3.1 Neutrons for spectroscopic measurements 219

10.3.2 Neutron scattering experimental methods: the triple-axis spectrometer 219
10.3.3 General formalism of neutron scattering 222
10.3.4 Applications of neutron inelastic scattering 226
10.4 Inelastic X-ray scattering 228
10.5 Light scattering 228
10.5.1 Basic idea of Raman scattering 228
10.5.2 Mechanism of Raman scattering 229
10.5.3 Applications of Raman spectroscopy 230
10.5.4 Brillouin scattering 231
10.6 Infrared absorption spectroscopy 231
Summary of chapter 233
Further reading 234
Exercises 234

11 Anharmonic interactions 236
11.1 Introduction 236
11.2 Thermal conductivity 239
11.3 Thermal expansion 241
11.3.1 Theory 241
11.3.2 Example: calculation of thermal expansion in fluorite 243
11.4 Temperature dependence of phonon frequencies 244
Summary of chapter 245
Further reading 246
Exercises 246

12 Displacive phase transitions 247
12.1 Introduction to displacive phase transitions 247
12.1.1 Importance of thermodynamic analysis 249
12.1.2 Various types of displacive phase transitions 250
12.2 Quantitative description of displacive phase transitions: the concept of the order parameter 252
12.2.1 The general definition of the order parameter 252
12.2.2 Examples of order parameters for specific phase transitions 254
12.2.3 Order parameters in other phase transitions 255
12.2.4 Experimental measurements of order parameter 255
12.2.5 First- and second-order phase transitions 256
12.3 Landau theory of displacive phase transitions 258
12.3.1 Qualitative behaviour of the free energy 258
12.3.2 Expansion of the free energy function for a second-order phase transition 259
12.3.3 Calculation of properties for a second-order phase transition 259
12.3.4 First-order phase transitions 261
12.3.5 The range of validity of Landau theory 262
12.4 Soft mode theory of displacive phase transitions 263
12.4.1 Basic idea of the soft mode 263

12.4.2 Ferroelectric soft modes 264
12.4.3 Zone boundary (antiferroelectric) phase transitions 265
12.4.4 Ferroelastic phase transitions 266
12.4.5 Incommensurate phase transitions 266
12.5 Lattice dynamical theory of the low-temperature phase 267
12.5.1 Lattice dynamical theories 267
12.5.2 Potential energy of the crystal 267
12.5.3 Phonon free energy 268
12.5.4 Full free energy and the Landau free energy function 269
12.5.5 Low-temperature behaviour 269
Summary of chapter 270
Further reading 272
Exercises 272

A Real crystals! 274
A.1 Reality against ideality 274
A.2 Point defects 275
A.2.1 Vacancies: Schottky defects 275
A.2.2 Interstitial defects: Frenkel defects 276
A.2.3 Coupled charge substitutions and vacancies 276
A.2.4 Colour centres 276
A.2.5 Diffusion and atomic mobility 276
A.3 Large-scale imperfections 277
A.3.1 Dislocations 277
A.3.2 Grain boundaries 277
A.3.3 Domains and domain walls 278
A.3.4 Surfaces and surface reconstructions 278
Summary of appendix 279
Further reading 279

B Fourier analysis 280
B.1 Fourier transforms as the extension of Fourier series 280
B.2 One-dimensional Fourier transform 280
B.3 Some one-dimensional Fourier transforms 281
B.3.1 Dirac δ function 281
B.3.2 Slit function 281
B.3.3 Symmetric exponential function 281
B.3.4 Gaussian function 282
B.4 Convolution theorem 282
Summary of appendix 283
Further reading 283

C Schoenflies representation of the point groups 284
C.1 The Schoenflies and International systems 284
C.2 Schoenflies labelling of non-cubic point groups 284
C.3 Schoenflies labelling of the cubic point groups 285
Summary of appendix 285
Further reading 285

D Rhombohedral, trigonal, and hexagonal unit cells 286
Summary of appendix 286
Further reading 286

E Space groups 287
E.1 Space group symbols 287
E.2 Defining symmetry 288
E.3 General and special positions 289
E.4 *The International Tables of Crystallography* 290
E.5 Relating general equivalent positions to actual atomic positions 290
Summary of appendix 291
Further reading 291

F Lattice energy minimization 292
Summary of appendix 292

G Some notes on the variational theorem 293
Summary of appendix 294
Further reading 294

H Ewald sphere 295
Summary of appendix 297
Further reading 297

I The Wilson plot 298
Summary of appendix 299
Further reading 299

J Diffraction from isotropic materials 300
J.1 Basic diffraction equations 300
J.2 Isotropic orientational averages 300
J.3 Pair distribution functions 301
J.4 Reverse Fourier transform 302
J.5 General approach to analysis of diffraction data 303
Summary of appendix 303
Further reading 303

K Calculation of physical properties 304
K.1 Expansion of the crystal energy 304
K.2 Equilibrium condition and the elastic constant tensor 304
K.3 Piezoelectric and dielectric tensors 305
Summary of appendix 306
Further reading 306

L Partition function: some key results 307
L.1 The definition and use of the partition function 307
L.2 The free energy 307
L.3 Some results 308
L.3.1 Heat capacity 308

L.3.2 Susceptibility 308
Summary of appendix 309
Further reading 309

M Lattice sums 310
Summary of appendix 310
Further reading 310

N Mean-square atomic displacement and temperature factors 311
Summary of appendix 313
Further reading 313
