Table of Contents

Preface xi
1 Introduction 1

1.1 Why a new book on sediment transport 1
1.1.1 A short guide through the content of this book 4

1.2 The phenomenon and its main parameters 4
1.2.1 A definition of the sediment transport 4
1.2.2 The parameters 5

1.3 The topography of a drainage area 12

1.4 Modeling the phenomenon 14

2 The classical representation of the sediment transport 19

2.1 The representation of the flow 20
2.1.1 The Reynolds decomposition 21
2.1.2 The flow equations 22
2.1.3 The velocity distribution and the influence of the roughness 23

2.2 The classical bed-load theories 29
2.2.1 Du Bois' description of the bed-load 29
2.2.2 Meyer-Peter's and similar descriptions of bed-load 30

3 Turbulence and the statistical aspects of the sediment transport 33

3.1 The incipient motion 33
3.1.1 The forces acting on a single grain 36

3.2 Statistical bed-load models 38
3.2.1 A first statistical formula, ... 38
3.2.2 Einstein's bed-load formula 39

3.2.3 The concept of Grass 42
3.2.4 The concept of coherent structures 43

3.3 Transport in suspension 49
3.3.1 A suspended particle in a turbulent flow 50
3.3.2 Particle swarms 55
3.3.3 The transport of suspension as described by a continuum mechanical model 65
3.3.4 The integration of the suspended load 55

3.4 The total sediment transport 65

3.5 Critical remarks 69
3.5.1 Form drag 69
3.5.2 Manifestation of separations. 70
3.5.3 New knowledge of the turbulent flow 70
3.5.4 The universality of a sediment transport equation? 70

4 Saturation and asymptotic states 73

4.1 Sediment transport as a dynamical process 73

4.2 Hypotheses of extremum principle 75
4.2.1 Continuity arguments 75
4.2.2 Momentum arguments 75
4.2.3 Energy arguments 77

4.3 The expanded description of Grass 80

4.4 Limitations 82

5 Problematic issues 85

5.1 Assumptions and consequences of rheological nature 85
5.1.1 Influence of colloidal forces 87
5.1.2 The influence of Brownian motions 88
5.1.3 The influence of the viscosity 89
5.1.4 Rheological aspects of two-phase flows with a large grain size distribution 91
5.1.5 Two-phase flows 93

5.2 Non-local properties of the flow field 93
5.2.1 Non-local properties of the flow field without sediment 94
5.2.2 Non-local properties of a sediment laden flow field 97

5.3 Nonlinear processes 100

6 Scales 107

6.1 The river as a system and its hydrological scales 107

6.2 The scaling of the turbulent flow 108
6.2.1 The statistical scales of the turbulent flow 109
6.2.2 Elements of large scales 117
6.2.3 Higher moments of the fluctuations and related scales 119
6.2.4 Structure functions 122
6.2.5 The scales of the coherent structures 123
6.2.6 The quadrant representation 128
6.2.7 Some remarks on the energy equation and the pressure field 129

7 Roughness and roughness elements 133

7.1 Similarity consideration in the range of constant wall shear stress 133

7.2 Sand roughness 135

7.3 *d*-Roughness 137

7.4 Real roughness 139

8 Flow separation, topology, and vortical dynamics 143

8.1 Flow separation 143

8.2 Basics in topology 145

8.3 Separation bubbles 150
8.3.1 The closed separation bubble 150

8.3.2 The open separation bubble 151
8.3.3 Separations on 3D obstacles 153

8.4 Vortex tubes and vortex interactions 156

9 Fine-sand dynamics 161

9.1 Stable beds and incipient motion 161

9.2 Sediment stripes as a bed form 166

9.3 The arrowhead, like bed forms 168

9.4 The ripple formation 169
9.4.1 The separation concept 170
9.4.2 The relation between ripples and coherent structures 171
9.4.3 The ripple formation mechanism 172
9.4.4 Alternative concepts of a ripple formation 178
9.4.5 The flow resistance of ripples 180
9.4.6 The importance of ripple formations 181

9.5 Dunes of fine-sand 182
9.5.1 The feedback mechanisms 183
9.5.2 The development of dunes as described in the literature 186
9.5.3 An attempt to find a statistical theory for dunes 190
9.5.4 A vortex shedding theory 194
9.5.5 Asymptotic behavior of dunes 195

9.6 Antidunes 198

10 Mixtures of medium grain sizes 199

10.1 Armoring 199
10.1.1 State of the art 199
10.1.2 A hypothetical armoring mechanism 202

10.2 Turbulence dominated sediment transport 203

10.3 Sediment transport dominated by separation 203

10.4 Induced secondary flows 206

10.5 Bed forms due to sorting effects 210
10.5.1 Coarse dunes 211
10.5.2 Bed forms resulting from secondary flows 212
10.5.3 Additional bed forms 216

11 Gravel beds 219

11.1 Transport processes on gravel beds 219

11.2 Separation versus turbulence 222

11.3 Bed forms in gravel beds 223

11.4 Complexity and outlooks 224
11.4.1 Subclasses of the sediment 225
11.4.2 The morphological concept 225
11.4.3 The equal mobility approach 226

12 Data and strategies to calculate sediment transport 227

12.1 The input parameters 229
12.1.1 The description of a channel 230
12.1.2 The flow parameters 231

12.2 Coherent structures 240

12.3 Turbulent flows 242

12.4 Flow with separations 243
12.4.1 Flow separations at a roughness or a 3D obstacle 243
12.4.2 Flow separation at bed forms 246

12.5 Suspended load 247
12.5.1 Washload 247

12.6 The significance of experiments for the simulations 249

13 References 251

14 Appendix 269

14.1 Albert Einstein's letter of recommendation for his son 269

14.2 Tables 271
14.2.1 Table of physical values 271
14.2.2 Tables of sediment characterization 273

14.3 Graphs 274
14.3.1 The graphs for the Einstein sediment transport method with a guide for the usage of Einstein's method 274

14.4 Symbols 277

15 Subject Index 281
