

Contents

Chapter 1. Introduction	1
Chapter 2. Kerr-Newman-de-Sitter black holes	13
Chapter 3. The massless charged Dirac equation	17
3.1. Hamiltonian formulation	17
3.2. Separation of variables	20
3.3. Estimates on the eigenvalues of the angular operator	25
Chapter 4. The direct scattering problem	27
4.1. Stationary expression of the scattering matrix	27
4.1.1. The simplified reduced stationary scattering matrix	28
4.1.2. The simplified reduced time-dependent scattering matrix	31
4.1.3. The physical reduced scattering matrix	32
4.1.4. The global scattering matrix	36
4.1.5. Dependence on the Regge-Wheeler variable	39
4.2. Time-dependent expression of the scattering matrix	42
4.3. Link between the stationary and time-dependent expressions of the scattering matrices	45
4.3.1. First simplifications	46
4.3.2. Stationary formulation for $\hat{S}(\lambda)$	48
Chapter 5. Uniqueness results in the inverse scattering problem at fixed energy	55
Chapter 6. The angular equation and partial inverse result	61
6.1. The Frobenius method: construction and asymptotics of the generalized spherical harmonics $Y_{kl}(\lambda)$	61
6.2. Application to the uniqueness inverse problem: proofs of Theorems 5.3 and 5.4	63
Chapter 7. The radial equation: complexification of the angular momentum	67
7.1. Analytic properties of the Jost functions and matrix $A_L(\lambda, k, z)$	67
7.2. Nevanlinna class	72
7.3. A first uniqueness result	75
Chapter 8. Large z asymptotics of the scattering data	79
8.1. The Liouville transformation	80
8.2. Asymptotics of the Jost functions	83
8.3. Asymptotics of the scattering data	90
8.4. Derivatives of the scattering data with respect to z	91

Chapter 9. The inverse scattering problem	93
Appendix A. Growth estimate of the eigenvalues $\mu_{kl}(\lambda)$	97
Appendix B. Limiting Absorption Principles and scattering theory for H_0 and H	101
B.1. Abstract Mourre theory	102
B.2. Conjugate operators for H_0 and H	103
B.3. H -smooth theory and wave operators	108
Bibliography	111
