# Contents

1 **Definitions** ................................. 1  
1.1 Nearly Zero Energy Building (NZEB) .............. 1  
1.2 Building Envelope ............................. 1  
1.3 Thermal Insulation ............................. 1  
1.4 Airtightness ................................... 2  
1.5 Thermal Decoupling ............................. 2  
1.6 ETICS ......................................... 2  
1.7 Sick Building Syndrome ......................... 2  
1.8 Bioreceptivity .................................. 3  
1.9 Biofilm ........................................ 3  
1.10 Biodeterioration ............................... 3  

2 **Introduction** ................................. 5  

3 **Algal Growth on External Building Envelope** ............................. 7  
3.1 Most Common Varieties of Algae Proliferating  
on Building Envelope ............................. 7  
3.1.1 Cyanobacteria ................................ 10  
3.1.2 Microalgae .................................. 10  
3.2 Main Causes and Conditions of Growth ............. 12  
3.2.1 Presence of Water on the External Surfaces:  
The Driving Rain ................................. 14  
3.2.2 Presence of Water on External Surfaces:  
Condensation .................................... 14  
3.2.3 Additional Environmental and Climatic Factors  
............................................. 15  
3.2.4 Influence of Technical and Manufacturing Solutions  
.................................................................. 17  
3.3 Consequences for Durability and Performance  
of Building Elements ............................. 20  

References ........................................... 22  

4 **Development of Mould in Indoor Environments** .......................... 25  
4.1 Mould Life Cycle ................................. 25  
4.2 Main Causes and Conditions of Growth ............. 26  
4.2.1 Environmental Factors ......................... 27  

Nearly zero energy buildings and proliferation of ...

Schweizerischen Nationalbibliothek  
2013
5 Analytical and Experimental Methods for the Assessment of the Biological Proliferation in Buildings

5.1 Analytical Models
5.1.1 Models of Biological Growth on Facades
5.1.2 Models of Internal Mould Growth

5.2 Accelerated Experimental Testing
5.2.1 Algae
5.2.2 Mould

References

6 Nearly Zero Energy Buildings and Proliferation of Microorganisms

6.1 Why NZEB Could be at Greater Biological Risk?
6.1.1 The ‘Thermal Decoupling Phenomenon’ in NZEB
6.1.2 Internal Moisture Loads in NZEB

6.2 Proliferation of Microorganisms on NZEB Facades
6.3 Mould Growth Inside NZEB

References

7 Remedial Actions and Future Trends

7.1 Traditional Methods
7.1.1 Mechanical Methods
7.1.2 Chemical Methods
7.1.3 Physical Methods

7.2 A Promising Prospect: Innovative Engineered Nanoparticles

7.3 Prevention and Control Strategies in NZEB
