Contents

1 Temporal Project Scheduling **1**

1.1 Minimum and maximum time lags 1
1.2 Activity–on–node project networks 6
1.3 Temporal project scheduling computations 9
1.4 Orders in the set of activities 15

2 Resource–Constrained Project Scheduling — Minimization of Project Duration **21**

2.1 Formulation of the problem 24
2.2 Cycle structures in activity–on–node project networks 26
2.3 Properties of the feasible region 29
2.3.1 Strict orders and order polyhedra 30
2.3.2 Forbidden sets and resolution of resource conflicts . . . 33
2.4 Different types of shifts and sets of schedules 38
2.5 Branch–and–bound and truncated branch–and–bound methods 45
2.5.1 Enumeration scheme 45
2.5.2 Preprocessing 53
2.5.3 Lower bounds 59
2.5.4 Branch–and–bound algorithm 62
2.5.5 Truncated branch–and–bound methods 65
2.5.6 Alternative enumeration schemes 69
2.5.7 Alternative preprocessing and constraint propagation . 71
2.5.8 Alternative lower bounds 74
2.6 Priority–rule methods 80
2.6.1 Direct method 81
2.6.2 Decomposition methods 82
2.6.3 Priority rules 83
2.6.4 Serial generation scheme 84
2.6.5 Parallel generation scheme 90
2.7 Schedule–improvement procedures 93
2.7.1 Genetic algorithm 94
2.7.2 Tabu search 97
2.8 Experimental performance analysis 101
2.8.1 Random generation of projects 101
2.8.2 Computational experience 105

2.9 Application to make–to–order production in manufacturing industry . . . 111
2.10 Regular objective functions different from project duration . . 117
2.11 Calendarization . . . 120
2.12 Project scheduling with cumulative resources . . . 127
2.13 Project scheduling with sequence–dependent changeover times 136
2.14 Multi–mode project scheduling problems . . . 146
2.14.1 Problem formulation and basic properties . . . 147
2.14.2 Solution methods . . . 153
2.15 Application to batch production in process industries . . . 163
2.15.1 Case study . . . 164
2.15.2 Project scheduling model . . . 168
2.15.3 Enumeration scheme . . . 171

3 Resource–Constrained Project Scheduling — Minimization of General Objective Functions 175
3.1 Different objective functions . . . 177
3.2 Additional types of shifts and sets of schedules . . . 185
3.3 Classification of objective functions . . . 196
3.3.1 Separable and resource–utilization dependent objective functions . . . 197
3.3.2 Class 1 of regular objective functions . . . 199
3.3.3 Class 2 of antiregular objective functions . . . 200
3.3.4 Class 3 of convex objective functions . . . 201
3.3.5 Class 4 of binary–monotone objective functions . . . 202
3.3.6 Class 5 of quasiconcave objective functions . . . 203
3.3.7 Class 6 of locally regular objective functions . . . 205
3.3.8 Class 7 of locally quasiconcave objective functions . . . 210
3.4 Time complexity of time–constrained project scheduling . . . 214
3.5 Relaxation–based approach for function classes 1 to 5 . . . 223
3.5.1 General enumeration scheme . . . 223
3.5.2 Branch–and–bound algorithm for the net present value problem . . . 226
3.5.3 Branch–and–bound algorithm for the earliness–tardiness problem . . . 243
3.6 Tree–based approach for function classes 6 and 7 . . . 246
3.6.1 General enumeration scheme . . . 247
3.6.2 Branch–and–bound algorithms for resource investment, resource levelling, and resource renting problems . . . 254
3.6.3 Experimental performance analysis . . . 264
3.7 Priority–rule methods . . . 265
3.7.1 Time–constrained project scheduling . . . 266
3.7.2 Resource–constrained project scheduling . . . 277
3.7.3 Experimental performance analysis . . . 286

3.8 Schedule improvement procedures 288
3.8.1 Neighborhoods for project scheduling problems 288
3.8.2 A tabu search procedure 297
