Quantum Cohomology

Introduction 1

Localization and Gromov-Witten Invariants
K. Behrend 3

1. Introduction 3
2. Lecture I: A short introduction to stacks 3
   - 2.1 What is a variety? 3
   - 2.2 Algebraic spaces 5
   - 2.3 Groupoids 8
   - 2.4 Fibered products of groupoids 9
   - 2.5 Algebraic stacks 11
3. Lecture II: Equivariant intersection theory 15
   - 3.1 Intersection theory 15
   - 3.2 Equivariant theory 16
   - 3.3 Comparing equivariant with usual intersection theory 19
   - 3.4 Localization 20
   - 3.5 The residue formula 21
4. Lecture III: The localization formula for Gromov-Witten invariants 25
   - 4.1 The fixed locus 28
   - 4.2 The first step 32
   - 4.3 The second step 33
   - 4.4 The third step 35
   - 4.5 Conclusion 37

Fields, Strings and Branes
César Gómez andRafael Hernández 39

Introduction 39
1. Chapter I 42
   - 1.1 Dirac Monopole 42
   - 1.2 The 't Hooft-Polyakov Monopole 43
   - 1.3 Instantons 46
   - 1.4 Dyon Effect 49
   - 1.5 Yang-Mills Theory on T^4 50
   - 1.5.1 The Toron Vortex 53
   - 1.5.2 't Hooft's Toron Configurations 54
   - 1.6 Instanton Effective Vertex 56

1.7 Three Dimensional Instantons 58
1.7.1 Callias Index theorem 60
1.7.2 The Dual Photon as Goldstone Boson 61
1.8 $N=1$ Supersymmetric Gauge Theories 62
1.9 Instanton Generated Superpotentials in Three Dimensional $N=2$ 65
1.9.1 A Toron Computation 67
2. Chapter II 68
2.1 Moduli of Vacua 68
2.2 $N=4$ Three Dimensional Yang-Mills 69
2.3 Atiyah-Hitchin Spaces 77
2.4 Kodaira's Classification of Elliptic Fibrations 78
2.5 The Moduli Space of the Four Dimensional $N=2$ Supersymmetric Yang-Mills Theory. The Seiberg-Witten Solution 81
2.6 Effective Superpotentials 87
3. Chapter III 94
3.1 Bosonic String 94
3.1.1 Classical Theory 94
3.1.2 Background Fields 96
3.1.3 World Sheet Symmetries 97
3.1.4 A Toroidal Compactification 97
3.1.5 σ-Model K3 Geometry. A First Look To A Quantum Cohomology 98
3.1.6 Elliptically Fibered K3 And Mirror Symmetry 104
3.1.7 The Open Bosonic String 105
3.1.8 D-Branes 106
3.1.9 Chan-Paton Factors And Wilson Lines 107
3.2 Superstring Theories 109
3.2.1 Toroidal Compactification of Type iia and Type iib Theories. U-Duality 111
3.2.2 Etherotic String 116
3.2.3 Etherotic Compactification to Four Dimensions 119

4. Chapter IV 122
4.1 M-Theory Compactifications 122
4.2 M-Theory Instantons 125
4.3 D-Brane Configurations in Flat Space 128
4.4 D-Brane Description of Seiberg-Witten Solution 136
4.4.1 M-Theory and Strogn Coupling 143
4.5 Brane Description of $N=1$ Four Dimensional Field Theories 147
4.5.1 Rotation of Branes 150
4.5.2 QCD Strings and Scales 151
4.5.3 $N=2$ Models With Vanishing Beta Functions 155

4.6 M-Theory and String Theory 157
4.7 Local Models for Elliptic Fibrations 161
4.8 Singularities of Type $\hat{D}_4$: $\mathbf{Z}_2$ Orbifolds 163
4.9 Singularities of Type $\hat{A}_{n-1}$ 165
4.10 Singularities of Type $\hat{D}_{n+4}$ 167
4.11 Decompactification and Affinization 167
4.12 M-Theory Instantons and Holomorphic Euler Characteristic 168
4.13 θ-Parameter and Gaugino Condensates 170
4.14 Domain Walls and Intersections 174

A. M(atrix) Theory 177
A.1 The Holographic Principle 177
A.2 Toroidal Compactifications 180
A.3 M(atrix) Theory and Quantum Directions 182

A.4Acknowledgments 184

q-Hypergeometric Functions and Representation Theory
Vitali Tarasov 193

Introduction 193
1. One-dimensional differential example 196
2. One-dimensional difference example 200
3. The hypergeometric Riemann identity 208
3.1 Basic notations 208
3.2 The hypergeometric integral 210
3.3 The hypergeometric spaces and the hypergeometric pairing . 211
3.4 The Shapovalov pairings 214
3.5 The hypergeometric Riemann identity 215

4. Tensor coordinates on the hypergeometric spaces and the hypergeometric maps 216
4.1 Bases of the hypergeometric spaces 216
4.2 Tensor coordinates and the hypergeometric maps 218
4.3 Difference equations for the hypergeometric maps 219
4.4 Asymptotics of the hypergeometric maps 221
4.5 Proof of the hypergeometric Riemann identity 223

5. Discrete local systems and the discrete Gauss-Manin connection . 224
5.1 Discrete flat connections and discrete local systems 225
5.2 Discrete Gauss-Manin connection 227
5.3 Discrete local system associated with the hypergeometric integrals 228
5.4 Periodic sections of the homological bundle via the hypergeometric integral 234

6. Asymptotics of the hypergeometric maps 237

7. The quantum loop algebra $U_q'(\widetilde{\mathfrak{gl}_2})$ and the qKZ equation 239
7.1 Highest weight $U_q(\mathfrak{sl}_2)$-modules 240
7.2 The quantum loop algebra $U_q'(\widetilde{\mathfrak{gl}_2})$ 240
7.3 The trigonometric qKZ equation 243
7.4 Tensor coordinates on the trigonometric hypergeometric spaces 245

8. The elliptic quantum group $E_{\rho,\gamma}(\mathfrak{sl}_2)$ 248
8.1 Modules over the elliptic quantum group $E_{\rho,\gamma}(\mathfrak{sl}_2)$ 248
8.2 Tensor coordinates on the elliptic hypergeometric spacess ... 251
8.3 The hypergeometric maps 254

9. Asymptotic solutionss of the qKZ equation 257
A. Six determinant formulae 261
B. The Jackson integrals via the hypergeometric integrals 264

Constructing symplectic invariants
Gang Tian 269

Introduction 269
1. Euler class of weakly Fredholm V-bundles 270
1.1 Smooth stratified orbispaces 270
1.2 Weakly pseudocycles 272
1.3 Weakly Fredholm V-bundles 273
1.4 Construction of the Euler class 276

2. GW-invariants 283
2.1 Stable maps 283
2.2 Stratifying the space of stable maps 285
2.3 Topology of the space of stable maps 287
2.4 Compactness of moduli spaces 289
2.5 Constructing GW-invariants 299
2.6 Composition laws for GW-invariants 302
2.7 Rational GW-invariants for projective spaces 303

3. Some simple applications 303
3.1 Quantum cohomology 304
3.2 Examples of symplectic manifolds 306
