Preface		<i>page</i> xi
Chapter 1. I	ntroduction	1
1.1	Truncated regression models	1
1.2	Censored regression models	3
1.3	Dummy endogenous variables	6
Chapter 2. I	Discrete regression models	13
2.1	What are discrete regression models?	13
2.2	The linear probability model	15
2.3	The linear discriminant function	16
2.4	Analogy with multiple regression and the linear	
	probability model	18
2.5	The probit and logit models	22
2.6	Comparison of the logit model and normal	
	discriminant analysis	27
2.7	The twin linear probability model	28
2.8	The case of multiple observations: minimum	
	chi-square methods	28
2.9	Illustrative examples with grouped data	32
2.10	Polychotomous variables: unordered variables	34
2.11	Measures of goodness of fit	37
2.12	Multinomial logit and McFadden's conditional	
	logit	41

2.13 Polychotomous variables: ordered-response d6

2.16 Estimation of logit models with randomized data 54 2.17 Estimation of logit and probit models from panel data 56 Chapter 3. Probabilistic-choice models 59 3.1 McFadden's conditional logit model 59 3.2 The Luce model 61 3.3 The multinomial probit model 62 3.4 The elimination-by-aspects model 64 3.5 The hierarchical elimination-by-aspects model 67 3.6 The nested multinomial logit model 67 3.6 The egneralized extreme-value model 70 3.7 The generalized extreme-value model 70 3.8 The relationship between the NMNL model and the GEV model 72 3.9 Estimation methods 73 3.10 Goodness-of-fit measures 76 3.11 Some tests for specification error 77 3.12 Concluding remarks 78 Chapter 4. Discriminant analysis 79 79 4.1 Introduction 79 4.2 The case of two populations 79 4.3 Prior probabilities and co	vi	Conte	nts	
2.15 Noncategorical variables: Poisson regression 51 2.16 Estimation of logit models with randomized data 54 2.17 Estimation of logit and probit models from panel data 56 Chapter 3. Chapter	8. T	wo-stage estimation methods	221
	8.1	Introduction	221
	8.2	Two-stage method for the tobit model	221
	8.3	Two-stage methods for switching regression	
		models	223
	8.4	Two-stage estimation of censored models	228
	8.5	Two-stage estimation of Heckman's model	231
	8.6	Two-stage estimation of structural equations	234
	8.7	Probit two-stage and tobit two-stage methods	240
	8.8	Two-stage methods for models with mixed	
		qualitative, truncated, and continuous variables	242
	8.9	Some alternatives to the two-stage methods	247
	8.10	Some final comments	252
		Appendix: Asymptotic covariance matrices for	
		the different two-stage estimators	252
Chapter	9. M	odels with self-selectivity	257
•	9.1	Introduction	257
	9.2	Self-selection and evaluation of programs	260
	9.3	Selectivity bias with nonnormal distributions	267
	9.4	Some general transformations to normality	272
	9.5	Polychotomous-choice models and selectivity	
		bias	275
	9.6	Multiple criteria for selectivity	278
	9.7	Endogenous switching models and	
		mixture-distribution models	283
	9.8	When can the selection model be used, but not	
		the mixture model?	288
	9.9	Summary and conclusions	289
Chapter	· 10. I	Disequilibrium models	291
	10.1		291
	10.2	The Fair and Jaffee model	292
		Maximum-likelihood methods: sample	272
		separation unknown	296
	10.4	Maximum-likelihood methods: sample	270
		separation known	305
	10.5	Some generalized disequilibrium models	310
	10.6	Price adjustment and disequilibrium	319
	10.7	Models with controlled prices	326
	10.8		335

Conte	nts	iz
10.9 10.10		337
10.10	centrally planned economies	341
10.11		343
Chapter 11. S	ome applications: unions and wages	347
11.1	Introduction	347
11.2	The Ashenfelter-Johnson study	34
11.3	The Schmidt and Strauss study	349
11.4	Lee's binary-choice model	350
11.5	Alternative specifications of the	
	unionism-wages model	359
11.6	The Abowd and Farber study	362
11.7	Summary and conclusions	364
Appendix: So	me results on truncated distributions	36
Bibliography	ine results on truncated distributions	373
