

Contents

1.	Charge carriers	11
1.1.	The properties of the electron	11
1.2.	The properties of ions	12
2.	Electrons in solids**	13
2.1.	Translational invariance	14
2.2.	Free-electron approximation	18
2.3.	Nearly-free electron approximation	21
2.4.	Tight binding approximation	24
2.5.	Electronic states influenced by a magnetic field	26
2.6.	Localized electron states induced by disorder	29
3.	Electron transport theory**	32
3.1.	Crystal electrons, group velocity, effective mass	32
3.2.	Boltzmann equation	34
3.3.	Relaxation time approximation	36
3.4.	Transport equations ($\mathbf{B} = 0$)	38
3.5.	Transport equations ($\mathbf{B} \neq 0$)	40
3.6.	Scattering mechanisms	44
3.6.1.	Deformation potential scattering	45
3.6.2.	Piezoelectric potential scattering	46
3.6.3.	Optical phonon scattering	46
3.6.4.	Intervalley phonon scattering	48
3.6.5.	Neutral impurity scattering	48
3.6.6.	Ionized impurity scattering	49
3.6.7.	Space charge scattering	49
3.6.8.	Electron-electron scattering	50
3.7.	Kubo formalism of electronic transport	50
4.	Quasiparticles	54
4.1.	Quasiparticle-conception	54
4.2.	Phonons	54
4.3.	Polarons	56
4.4.	Plasmons	58

4.5.	Excitons	59
4.6.	Polaritons	61
4.7.	Solitons	62
5.	Charge transport in conductors	66
5.1.	Ohm's law	66
5.1.1.	Conductivity of metals	66
5.1.2.	Hall effect	69
5.1.3.	Magnetoresistance	70
5.1.4.	Thermoelectric power	71
5.1.5.	Bloch-Grüneisen law	71
5.1.6.	Residual resistivity	77
5.2.	Characteristics of transition metals	78
5.3.	Metal-insulator transition	80
5.4.	Superconductivity	82
5.4.1.	Cooper pairs	82
5.4.2.	Ground state of the BCS-superconductor	83
5.4.3.	The lowest excited state of a BCS-superconductor	84
5.4.4.	The density of states of the BCS-superconductor	85
5.4.5.	The ground state energy of the BCS-superconductor at $T > 0$ K	85
5.4.6.	The energy gap of a BCS-superconductor at $T > 0$ K	87
5.4.7.	The transition temperature of a BCS-superconductor	87
5.4.8.	Current flow through a superconductor	88
5.4.9.	Superconductors of second type	89
5.4.10.	Other mechanisms of superconductivity	90
6.	Charge transport in low-dimensional conductors	91
6.1.	The two-dimensional electron gas	91
6.1.1.	The subbands of the two-dimensional electron gas	92
6.1.2.	The conductivity of the two-dimensional electron gas	94
6.1.3.	Two-dimensional hopping conductivity	95
6.1.4.	The two-dimensional electron gas in a magnetic field	96
6.1.5.	Transverse conductivity and Hall conductivity of the two-dimensional electron gas	97
6.1.6.	Quantum Hall effect	98
6.2.	Quasi one-dimensional conductors	101
6.2.1.	Peierls-Fröhlich model	101
6.2.2.	Peierls-Fröhlich transition	104
6.2.2.1.	Electron transport above and below the Peierls transition	104
6.2.2.2.	Landau theory of the Peierls-Fröhlich transition	106
6.2.2.3.	Dynamics of the Peierls-Fröhlich system	107
6.2.3.	Charge density wave — Fröhlich conductivity	111
6.2.4.	Charge transport by solitons	116
7.	Charge transport in semiconductors	120
7.1.	Band model	121
7.1.1.	Band structure of intrinsic semiconductors	121
7.1.2.	Band structure of extrinsic semiconductors	124
7.2.	Charge carrier concentration in thermodynamic equilibrium	125
7.2.1.	Electron and hole concentration in intrinsic semiconductors	125
7.2.2.	The electron concentration in impurity states (with single charge exchange)	127

7.2.3.	Semiconductor with singly rechargeable donors and acceptors — the compensated semiconductor	132
7.3.	Basis equations for charge transport in semiconductors	134
7.4.	Steady state charge transport in homogeneous semiconductors	137
7.4.1.	Basic equations	137
7.4.2.	Spatially independent charge carrier densities — ohmic conduction	139
7.4.3.	Charge carrier mobility in semiconductors	140
7.4.4.	The influence of an electric field on the mobility	147
7.4.4.1.	Acoustical phonon scattering	148
7.4.4.2.	Nonpolar optical intervalley phonon scattering	151
7.4.4.3.	Polar optical phonon scattering	152
7.5.	pn-junction	160
7.5.1.	pn-junction in thermodynamic equilibrium	160
7.5.2.	Current flow through a pn-junction	163
7.6.	Electronic properties of Metal-Insulator-Semiconductor(MIS)-structures	167
7.6.1.	Structure and operating mode	167
7.6.2.	The I-U-characteristic of an n-channel enhancement transistor	169
7.6.3.	The influence of a field dependent mobility	171
8.	Charge transport in insulators	173
8.1.	Ionic conduction	173
8.2.	Injection limited electronic conduction	174
8.2.1.	Fowler-Nordheim tunneling	174
8.2.2.	Schottky emission	177
8.2.3.	Field emission at $T > 0$ K.	178
8.2.4.	Thermionic field emission	180
8.2.5.	Internal photoemission	181
8.3.	Transport limited electronic conductivity	184
8.3.1.	Tunneling through thin films	184
8.3.2.	Space charge limited currents	190
8.3.2.1.	Space charge limited current in a vacuum diode	190
8.3.2.2.	The conception of ohmic contact	191
8.3.2.3.	Types of trapping centres	192
8.3.2.4.	Child's law	192
8.3.2.5.	Insulator with own charge carriers	193
8.3.2.6.	Insulator with discrete traps	194
8.3.2.7.	Insulator with uniform trap distribution.	196
8.3.2.8.	Insulator with exponential trap distribution	197
8.3.2.9.	Space charge limitation by Gaussianly distributed traps	199
8.3.2.10.	The influence of spatially distributed traps and more than one Gaussian trap distribution	201
8.3.2.11.	Simultaneous injection of electrons and holes	201
8.3.3.	Poole-Frenkel effect	206
8.3.4.	Hopping conduction	209
8.3.4.1.	The Anderson localization	209
8.3.4.2.	The Kubo-Greenwood formula	210
8.3.4.3.	Evaluation of σ_0	212
8.3.4.4.	Nearest-neighbour hopping	213
8.3.4.5.	Variable range hopping	214
8.3.4.6.	Photon activated hopping	215
8.4.	Break down	215
8.4.1.	Thermal break down	216
8.4.2.	Electric break down	217

9.	Selected problems	219
9.1.	Charge transport in superionic conductors	219
9.1.1.	Superionic conduction — what conditions are necessary?	219
9.1.2.	The superionic conductivity	219
9.2.	Conductivity of discontinuous metal films	220
9.3.	Inelastic tunneling	222
9.4.	Josephson-tunneling	226
9.5.	Conduction in composite materials-percolation	229
9.6.	Size effects	232
9.6.1.	Fuchs' analysis for thin films	232
9.6.2.	Size effects in semiconductors	234
9.7.	Ballistic transport in semiconductors	234
10.	Photoconductivity	236
10.1.	The photoconductor concept	236
10.2.	Photoconductor at homogeneous generation	236
10.3.	Photoconduction at non-linear recombination	238
10.4.	Photoconductivity at generation from impurities	240
10.5.	Photoconductivity under influences of recombination centres.	242
10.6.	Photoconductivity under influence of traps	244
10.7.	Photoconductivity at inhomogeneous generation	245
10.8.	Dember effect	246
10.9.	pn-Solar cell.	247
11.	ac- and transient measurements	250
11.1.	Small signal behaviour	250
11.2.	Frequency behaviour for space charge limited current flow	252
11.2.1.	Basic equations for ac-analysis	252
11.2.2.	The admittance of a sample with discrete acceptor traps under neglect of diffusion currents.	255
11.3.	Transient measurements.	264
11.3.1.	Starting equations for transient analysis	264
11.3.2.	Experimental study of $I(t)$ -characteristics	267
11.4.	Emission currents from traps at surfaces	270
11.5.	Current-time characteristics by electron tunneling into a single trapping level in a dielectric	272
11.6.	Dispersive charge transport	273
11.6.1.	Scher-Montroll model — stochastic hopping	273
11.6.2.	Dispersive charge transport controlled by traps	276
