	Introduction	1
1	Role of Solar Energy in the National Economy	1
2	Photoelectrochemistry as the Theoretical Basis of a Solar Energy Conversion Method	3
3	Stages of a Photoelectrochemical Process	5
4	Advantages of Semiconductor Photoelectrochemical Cells for Solar Energy Conversion	6
1	Fundamentals of Describing the Structure of the Semiconductor/Electrolyte Interface and its Photoelectrochemical Reactions	8
1.1	Aspects of the Physics of Semiconductors	8
1.2	Action of Light on Semiconductors	11
1.3	Energy and Electrochemical Potential Levels in the Electrolyte Solution	13
1.4	Structure of the Semiconductor/Electrolyte Solution Interface	19
1.5	Kinetics of Electrochemical Reactions on Semiconductor Electrodes	28
2	Processes Underlying the Action of Semiconductor Photoelectrochemical Cells	32
2.1	Fundamentals of Describing Photoelectrochemical Reactions on Semiconductor Electrodes	32
2.2	Photocorrosion and Protection of Semiconductor Electrodes	41
2.3	Types of Photoelectrochemical Reactions and Classification of Photoelectrochemical Cells	43
2.4	Characteristics of a Photoelectrochemical Cell	45
3	Solar Energy Conversion into Chemical Energy. Cells for Photoelectrolysis of Water	51
3.1	Basic Problems	51
3.2	Photoassisted Electrolysis of Water	58
3.3	Two-Quantum Photoelectrolysis of Water	64
3.4	Two-Stage Conversion of Solar Energy: Generation of Electrical Energy Followed by Electrolysis of Water	71
3.5	Oxide Photoanodes for Photoelectrolysis of Water	81

4	Solar Energy Conversion into Chemical Energy. Cells for Photoelectrolysis of Inorganic (other than Water) and Organic Substances	92
4.1	Photodecomposition of Hydrogen Halide Acids and other Inorganic Compounds	92
4.2	Photoelectrochemical Reactions of Organic Compounds	96
4.3	Photoelectrodes Made of Semiconductors with a Layered Crystal Lattice: Photointercalation and Photodeintercalation Processes	97
5	Solar Energy Conversion into Chemical Energy. Suspensions and Colloidal Systems	106
5.1	Mechanisms of Photoelectrochemical Processes in Microheterogeneous Systems	107
5.2	Microheterogeneous Systems: Fundamentals of their Preparation and Study Methods. Special Effects	113
5.3	Photosplitting of Water	117
5.4	Photodecomposition of H ₂ S and Sulfides. Other Reactions Involving the Participation of Inorganic and Organic Compounds	120
6	Solar Energy Conversion into Electrical Energy. Regenerative Photoelectrochemical Cells	123
6.1	Basic Problems	123
6.2	Description of Particular Systems	128
6.3	Liquid-Junction Solar Cells for Storage of Energy	140
7	Protective Coatings for Semiconductor Electrodes	143
7.1	Coatings of Metals and Degenerated Semiconductors	143
7.2	Coatings of Electrically Conductive Polymers	147
7.3	Electrodes with Chemically Modified Surface	150
	Conclusion	153
	References	154
	Subject Index	161
