Preface	v
Acknowledgments	vii
1 Overview of the Development and Application of Electrical Machines	1
2 Generalized AC Machines for the Design of Motion Control Devices	13
2.1 The vector property of the GEM system	13
2.2 The coil spatial mmf sinusoidal distribution	17
2.3 Principal devices as GEM design derivatives	26
3 Magnetic Transmission Line	67
3.1 Introduction: Distributed parameter electro-magnetic circuits	67
3.2 Electro-magnetic system differential equations	75
3.3 The core slot slashing concept	83
3.4 Teeth air gap harmonic analysis	90
3.5 Thin-walled rotary cylinder model (TCR)	100
3.6 Rotary cylinder equivalent circuit as an analogue to an electrical transmission line	104
3.7 The TCR and SCR self-inductance computational approach	106
3.8 Magnetic transmission line equations for sinusoidal systems	111
3.9 Torque function for TCR and SCR motors	128
3.10 Teeth variable permeance torque estimate	132
3.11 Permanent magnet switch phase synchronic motor . .	144
3.12 Hysteresis motor: principal physics and computational approach	163
3.13 Electro-magnetic circuit for a generalized electrical machine geometry (GEM)	168

3.14	Induction tachogenerator (ITG)	169
3.15	Resolver-Motor	173
3.16	Sin-Cos transformer magnetic circuit in general form	177
4	Motor Drive Circuits	181
4.1	Brief overview of closed-loop motor drive circuits	181
4.2	Self-oscillatory synchronic motor drive system	182
4.3	AC motor-magnetic amplifier integrity	188
4.4	Analytical consideration of the MMA concept	194
4.5	Simplified engineering approach	205
4.6	The over-synchronic speed motor control concept	231
5	Technological Inaccuracy in the Performance of Small Electrical Machines	240
5.1	Errors due to eccentricity of the internal rotation core	240
5.2	Errors due to external core air gap elliptical irregularity	249
5.3	Thin-walled rotor thickness irregularity	258
5.4	Desirable aspects of geometrical irregularity	265
6	Theory of Precise Sinusoidal Windings	271
6.1	Slotwise coil mmf analysis	271
6.2	A design methodology for symmetric two-phase coils	278
6.3	Condition to obtain the maximal coil Q -factor	283
6.4	Two-pole sin-cos system	286
6.5	Poly-pole coil sin-cos transformer	288
6.6	Determination of slot numbers to minimize undesirable harmonics	297
6.7	Ultra periodicity lithography systems	301
6.8	U-syne encoder concept	311
6.9	High-resolution brushless encoders	318
6.10	Digital interpolation concepts for encoder resolution multiplication	323
7	Induction Ferromagnetic Core Position Sensors	339
7.1	Slotwise brushless miniature systems	339
7.2	Multi-periodical brushless system "Indusyn"	347
7.3	Brushless permag DC motor integrated position encoder	357

7.4	Long-range angular linearity induction potentiometers (LIP)	376
7.5	LIP with a range of ± 160 degrees	387
7.6	“Sliding magnetic contact” induction potentiometer	391
7.7	Unipolar type of brushless system of ± 90 LIP range	394
7.8	Brushless differential transformer type of LIP ± 90	398
7.9	DC brushless potentiometer by using magneto-resistors	401
7.10	DC logometric torque actuator on the basis of the ± 90 degrees LIP	404
8	Spherical AC Electro-machine Systems as Free Gyro Instruments	408
8.1	Introduction	408
8.2	Analytical model of the spherical gyro-magnetic suspension system	416
8.3	Rotor current differential equation	422
8.4	Force computation	429
8.5	Impedance match condition in view of superconductivity	445
8.6	Feedback control	446
9	Electro-magnetic Strip Transmission Line Devices	450
9.1	General introduction	450
9.2	The $\mu - \rho$ strip MTL structure	451
9.3	The $\mu - \rho - \epsilon - \mu$ electro-magnetic and magneto-electric structure	456
9.4	Two-port μ -air- μ structures as magnetic analog-digital logometers	459
	Appendix	464
	Index	467
