Preface xi
Acknowledgments xiii

Basic notions and notation xv

Introduction. What is this book about? 1
What is Kolmogorov complexity? 1
Optimal description modes 2
Kolmogorov complexity 4
Complexity and information 5
Complexity and randomness 8
Non-computability of C and Berry's paradox 9
Some applications of Kolmogorov complexity 10

Chapter 1. Plain Kolmogorov complexity 15
1.1. Definition and main properties 15
1.2. Algorithmic properties 21

Chapter 2. Complexity of pairs and conditional complexity 31
2.1. Complexity of pairs 31
2.2. Conditional complexity 34
2.3. Complexity as the amount of information 45

Chapter 3. Martin-Löf randomness 53
3.1. Measures on Ω 53
3.2. The Strong Law of Large Numbers 55
3.3. Effectively null sets 59
3.4. Properties of Martin-Löf randomness 65
3.5. Randomness deficiencies 70

Chapter 4. A priori probability and prefix complexity 75
4.1. Randomized algorithms and semimeasures on $\mathbb{N}$ 75
4.2. Maximal semimeasures 79
4.3. Prefix machines 81
4.4. A digression: Machines with self-delimiting input 85
4.5. The main theorem on prefix complexity 91
4.6. Properties of prefix complexity 96
4.7. Conditional prefix complexity and complexity of pairs 102

Chapter 5. Monotone complexity 115
5.1. Probabilistic machines and semimeasures on the tree 115

Šen, Aleksandr Ch.
Kolmogorov complexity and algorithmic randomness
digitalisiert durch:
IDS Basel Bern

5.2. Maximal semimeasure on the binary tree 121
5.3. A priori complexity and its properties 122
5.4. Computable mappings of type $\Sigma \to \Sigma$ 126
5.5. Monotone complexity 129
5.6. Levin–Schnorr theorem 144
5.7. The random number Ω 157
5.8. Effective Hausdorff dimension 172
5.9. Randomness with respect to different measures 176

Chapter 6. General scheme for complexities 193
6.1. Decision complexity 193
6.2. Comparing complexities 197
6.3. Conditional complexities 200
6.4. Complexities and oracles 202

Chapter 7. Shannon entropy and Kolmogorov complexity 213
7.1. Shannon entropy 213
7.2. Pairs and conditional entropy 217
7.3. Complexity and entropy 226

Chapter 8. Some applications 233
8.1. There are infinitely many primes 233
8.2. Moving information along the tape 233
8.3. Finite automata with several heads 236
8.4. Laws of Large Numbers 238
8.5. Forbidden substrings 241
8.6. A proof of an inequality 255
8.7. Lipschitz transformations are not transitive 258

Chapter 9. Frequency and game approaches to randomness 261
9.1. The original idea of von Mises 261
9.2. Set of strings as selection rules 262
9.3. Mises–Church randomness 264
9.4. Ville's example 267
9.5. Martingales 270
9.6. A digression: Martingales in probability theory 275
9.7. Lower semicomputable martingales 277
9.8. Computable martingales 279
9.9. Martingales and Schnorr randomness 282
9.10. Martingales and effective dimension 284
9.11. Partial selection rules 287
9.12. Non-monotonic selection rules 291
9.13. Change in the measure and randomness 297

Chapter 10. Inequalities for entropy, complexity, and size 313
10.1. Introduction and summary 313
10.2. Uniform sets 318
10.3. Construction of a uniform set 321
10.4. Uniform sets and orbits 323
10.5. Almost uniform sets 324

10.6. Typization trick 326
10.7. Combinatorial interpretation: Examples 328
10.8. Combinatorial interpretation: The general case 330
10.9. One more combinatorial interpretation 332
10.10. The inequalities for two and three strings 336
10.11. Dimensions and Ingleton's inequality 337
10.12. Conditionally independent random variables 342
10.13. Non-Shannon inequalities 343

Chapter 11. Common information 351
11.1. Incompressible representations of strings 351
11.2. Representing mutual information as a string 352
11.3. The combinatorial meaning of common information 357
11.4. Conditional independence and common information 362

Chapter 12. Multisource algorithmic information theory 367
12.1. Information transmission requests 367
12.2. Conditional encoding 368
12.3. Conditional codes: Muchnik's theorem 369
12.4. Combinatorial interpretation of Muchnik's theorem 373
12.5. A digression: On-line matching 375
12.6. Information distance and simultaneous encoding 377
12.7. Conditional codes for two conditions 379
12.8. Information flow and network cuts 383
12.9. Networks with one source 384
12.10. Common information as an information request 388
12.11. Simplifying a program 389
12.12. Minimal sufficient statistics 390

Chapter 13. Information and logic 401
13.1. Problems, operations, complexity 401
13.2. Problem complexity and intuitionistic logic 403
13.3. Some formulas and their complexity 405
13.4. More examples and the proof of Theorem 238 408
13.5. Proof of a result similar to Theorem 238 using Kripke models 413
13.6. A problem whose complexity is not expressible in terms of the complexities of tuples 417

Chapter 14. Algorithmic statistics 425
14.1. The framework and randomness deficiency 425
14.2. Stochastic objects 428
14.3. Two-part descriptions 431
14.4. Hypotheses of restricted type 438
14.5. Optimality and randomness deficiency 447
14.6. Minimal hypotheses 450
14.7. A bit of philosophy 452

Appendix 1. Complexity and foundations of probability 455
Probability theory paradox 455
Current best practice 455

Simple events and events specified in advance 456
Frequency approach 458
Dynamical and statistical laws 459
Are "real-life" sequences complex? 459
Randomness as ignorance: Blum–Micali–Yao pseudo-randomness 460
A digression: Thermodynamics 461
Another digression: Quantum mechanics 463

Appendix 2. Four algorithmic faces of randomness 465
Introduction 465
Face one: Frequency stability and stochasticness 468
Face two: Chaoticness 470
Face three: Typicalness 475
Face four: Unpredictability 476
Generalization for arbitrary computable distributions 480
History and bibliography 486

Bibliography 491
