Andreas Kugi

Non-linear Control Based on Physical Models

Electrical, Mechanical and Hydraulic Systems

With 47 Figures

Springer

Contents

1. Fundamentals	1
1.1 Stability of Equilibria	1
1.1.1 Physical Observation I	2
1.1.2 Mathematical Formulation I: Lyapunov's Direct Method	3
1.1.3 Physical Observation II	3
1.1.4 Mathematical Formulation II: LaSalle's Invariance Principle	4
1.1.5 Exponential Stability	6
1.2 Dissipativity, Passivity and Positive Realness	6
1.2.1 Physical Observation III	6
1.2.2 Mathematical Formulation III: The Notion of Dissipativity	10
1.2.3 Passivity	11
1.2.4 Positive Realness	14
1.3 Absolute Stability and the Popov Criterion	19
1.3.1 Physical Observation IV	19
1.3.2 Mathematical Formulation IV: The Notion of Absolute Stability and the Popov Criterion	19
1.4 PCH-systems and PCHD-systems	23
2. Some Non-linear Control Design Strategies	27
2.1 Non-linear State Feedback H_2 -design	28
2.2 Non-linear State Feedback H_2 -design with Integral Term	32
2.3 Non-linear State Feedback H_∞ -design	35
2.4 Passivity-based Control (PBC)	38
3. Electromagnetic Systems	41
3.1 Basic Circuit Relations	41
3.2 Energy Based Description	44
3.2.1 Independent Set of Inductor Currents and Capacitor Voltages	44
3.2.2 Dependent Set of Inductor Currents and Capacitor Voltages	48
3.3 Energy Based Description with Full Topological Information	50

3.3.1	Dissipative Electrical Systems in the Form of a PCHD-system	50
3.3.2	Application: Simple Electric Circuit	55
3.3.3	Application: Three-phase Power System	57
3.4	PWM-controlled Electrical Systems	60
3.4.1	Energy Based Description	60
3.4.2	Energy Based Description with Full Topological Information	61
3.5	Application: Non-linear Control of a Ćuk-converter	67
3.5.1	Mathematical Model	68
3.5.2	Non-linear State Feedback H_2 -design	69
3.5.3	Non-linear State Feedback H_2 -design with Integral Term	70
3.5.4	The Experimental Setup	72
3.5.5	Measurement and Simulation Results of the Closed-loop	77
3.6	Electromechanical System: The Energy/Co-energy Concept ..	79
3.6.1	Simple Application: Specific Influence on the Electrostatic/Electromagnetic Coupling Force	82
4.	Mechanical PCH-systems	85
4.1	Fundamentals of Lagrangian and Hamiltonian Systems	86
4.1.1	The Finite-dimensional Case	86
4.1.2	The Infinite-dimensional Case	90
4.2	Controller Design Strategies	92
4.2.1	Preliminaries	92
4.2.2	Some Remarks Concerning the Stability of Infinite-dimensional Systems	95
4.2.3	Non-linear H_2 -design for PCH-systems	95
4.2.4	Non-linear H_∞ -design for PCH-systems	97
4.2.5	PD-design for PCH-systems	98
4.2.6	Disturbance Compensation for PCH-systems	99
4.3	Application: Control of Smart Piezoelectric Beam Structures ..	100
4.3.1	Preliminaries	101
4.3.2	Beam Structure under Consideration	103
4.3.3	Actuator and Sensor Design	104
4.3.4	Mathematical Model for the Beam with Lateral Loadings ..	109
4.3.5	Controller Design for the Beam with Lateral Loadings ..	112
4.3.6	Mathematical Model for the Beam with an Axial Support Motion	117
4.3.7	Controller Design for the Beam with an Axial Support Motion	118
5.	Hydraulic Drive Systems	121
5.1	Valve-controlled Translational Piston Actuator	121
5.1.1	Mathematical Model	122
5.1.2	Controller Design	125

5.2	Application: Hydraulic Gap Control (HGC) in Rolling Mills .	131
5.2.1	System Description	131
5.2.2	Mill Stand Model.....	132
5.2.3	Material Deformation Model	134
5.2.4	HGC with a Double-acting Hydraulic Ram	135
5.2.5	HGC with a Single-acting Hydraulic Ram	138
5.3	Rejection of Periodic Disturbances (Eccentricity Compensation)	142
5.4	Pump-displacement-controlled Rotational Piston Actuator ...	148
5.4.1	Mathematical Model of the Pump-motor-unit	149
5.5	Discrete Open-loop Observer for the Swash-plate Angle	156
5.5.1	Mathematical Model of a Swash-plate Mechanism	157
5.5.2	Model Simplification Based on Physical Considerations	159
5.5.3	Discrete Open-loop Observer and Measurement Results	162
