<i>Preface</i>	ix
1 Chemical equilibrium	1
1.1 Some introductory concepts	1
1.2 Equilibrium constants	3
1.3 Reaction quotient	8
1.4 LeChatelier's principle	10
<i>Exercises</i>	11
2 Chemical thermodynamics	17
2.1 The first law of thermodynamics; enthalpy	17
2.2 Enthalpies of reaction and formation	21
2.3 Entropy and the second law of thermodynamics	22
2.4 The third law of thermodynamics; absolute entropies	26
2.5 Criteria for equilibrium and spontaneous transformation	27
2.6 Standard free energy changes	30
2.7 Free energy change and the equilibrium constant	31
2.8 Chemical potential; homogeneous nucleation of water-vapor condensation	34
<i>Exercises</i>	38
3 Chemical kinetics	43
3.1 Reaction rates	43
3.2 Reaction mechanisms	46
3.3 Reaction rates and equilibria	50
3.4 Collision theory of gaseous reactions	52
3.5 The effect of temperature on reaction rates: the Arrhenius' relation	56

3.6	Catalysis	57
3.7	Half-life, residence time, and renewal time	58
	<i>Exercises</i>	61
4	Solution chemistry and aqueous equilibria	68
4.1	Definitions and types of solutions	68
4.2	Solution concentrations	69
4.3	Factors affecting solubility	70
4.4	Colligative properties	71
4.5	Aqueous solutions; electrolytes	72
4.6	Aqueous equilibria	73
4.7	Strong and weak electrolytes; ion-product constant for water	78
	<i>Exercises</i>	80
5	Acids and bases	83
5.1	Some definitions and concepts	83
5.2	The nature of H^+ (aq)	86
5.3	The Brønsted-Lowry theory; conjugate acid-base pairs	86
5.4	The Lewis theory	87
5.5	Strengths of acids and bases; acid-dissociation (or ionization) constant	87
5.6	The pH scale	89
5.7	Polyprotic acids	90
5.8	Hydrolysis	91
5.9	Buffers	93
5.10	Complex ions	96
5.11	Mass balance and charge balance relations	97
5.12	The pH of rainwater	98
	<i>Exercises</i>	101
6	Oxidation–reduction reactions	104
6.1	Some definitions	104
6.2	Oxidation numbers	105
6.3	Balancing oxidation–reduction reactions	108
6.4	Half-reactions in electrochemical cells	115
6.5	Strengths of oxidants and reductants; standard cell and half-cell potentials	116
6.6	Standard cell potentials and free-energy change	124
6.7	The Nernst equation	126
6.8	Redox potentials; Eh–pH diagrams	128

6.9	Gram-equivalent weight and normality	130
	<i>Exercises</i>	132
7	Photochemistry	137
	7.1 Some properties of electromagnetic waves	137
	7.2 Some photochemical terminology and principles	139
	7.3 Quantum yields	142
	7.4 Rate coefficients for photolysis	143
	7.5 Photostationary states	144
	7.6 Stratospheric ozone and photochemistry; depletion of stratospheric ozone	145
	<i>Exercises</i>	154
<i>Appendix I</i>	International system of units (SI)	157
<i>Appendix II</i>	Some useful numerical values	158
<i>Appendix III</i>	Atomic weights	159
<i>Appendix IV</i>	Equilibrium (or dissociation) constants for some chemical reactions	162
<i>Appendix V</i>	Some molar standard Gibbs free energies of formation, molar standard enthalpies (or heats) of formation and molar absolute entropies at 25°C and 1 atmosphere	169
<i>Appendix VI</i>	Names, formulas, and charges of some common ions	172
<i>Appendix VII</i>	Answers to exercises and hints and solutions to selected exercises	173
<i>Index</i>		189
