

G. W. Stewart

University of Maryland
College Park, Maryland

AFTERNOTES
goes to
GRADUATE
SCHOOL

Lectures on Advanced
Numerical Analysis

A series of lectures on advanced numerical
analysis presented at the University of Maryland
at College Park and recorded after the fact.

Society for Industrial and Applied Mathematics

Philadelphia

Contents

Preface	xi
Approximation	1
Lecture 1	3
General observations	3
Decline and fall	3
The linear sine	6
Approximation in normed linear spaces	7
Significant differences	9
Lecture 2	11
The space $C[0, 1]$	11
Existence of best approximations	12
Uniqueness of best approximations	12
Convergence in $C[0, 1]$	12
The Weierstrass approximation theorem	13
Bernstein polynomials	14
Comments	16
Lecture 3	17
Chebyshev approximation	17
Uniqueness	20
Convergence of Chebyshev approximations	21
Rates of convergence: Jackson's theorem	21
Lecture 4	23
A theorem of de la Vallée Poussin	23
A general approximation strategy	24
Chebyshev polynomials	25
Economization of power series	26
Farewell to $C[a, b]$	28
Lecture 5	31
Discrete, continuous, and weighted least squares	31
Inner-product spaces	32
Quasi-matrices	33
Positive definite matrices	34
The Cauchy and triangle inequalities	35
Orthogonality	36
The QR factorization	37
Lecture 6	39
Existence and uniqueness of the QR factorization	39
The Gram-Schmidt algorithm	40
Projections	41
Best approximation on inner-product spaces	43

Lecture 7	47
Expansions in orthogonal functions	47
Orthogonal polynomials	48
Discrete least squares and the QR decomposition	52
Lecture 8	57
Householder transformations	57
Orthogonal triangularization	59
Implementation	62
Comments on the algorithm	63
Solving least squares problems	64
Lecture 9	67
Operation counts	67
The Frobenius and spectral norms	68
Stability of orthogonal triangularization	69
Error analysis of the normal equations	70
Perturbation of inverses and linear systems	71
Perturbation of pseudoinverses and least squares solutions	73
Summary	77
Linear and Cubic Splines	79
Lecture 10	81
Piecewise linear interpolation	81
The error in $L(f)$	83
Approximation in the ∞ -norm	84
Hat functions	84
Integration	85
Least squares approximation	86
Implementation issues	88
Lecture 11	93
Cubic splines	93
Derivation of the cubic spline	94
End conditions	95
Convergence	97
Locality	97
Eigensystems	103
Lecture 12	105
A system of differential equations	105
Complex vectors and matrices	106
Eigenvalues and eigenvectors	107
Existence and uniqueness	108
Left eigenvectors	108
Real matrices	108

Multiplicity and defective matrices	109
Functions of matrices	110
Similarity transformations and diagonalization	111
The Schur decomposition	112
Lecture 13	115
Real Schur form	115
Block diagonalization	116
Diagonalization	118
Jordan canonical form	119
Hermitian matrices	120
Perturbation of a simple eigenvalue	120
Lecture 14	125
A backward perturbation result	125
The Rayleigh quotient	126
Powers of matrices	127
The power method	131
Lecture 15	135
The inverse power method	135
Derivation of the QR algorithm	137
Local convergence analysis	139
Practical considerations	141
Hessenberg matrices	142
Lecture 16	145
Reduction to Hessenberg form	145
The Hessenberg QR algorithm	147
Return to Upper Hessenberg	149
Lecture 17	151
The implicit double shift	151
Some implementation details	153
The singular value decomposition	155
Lecture 18	157
Rank and Schmidt's theorem	157
Computational considerations	158
Reduction to bidiagonal form	159
Plane rotations	161
The implicit QR algorithm for singular values	162
Krylov Sequence Methods	165
Lecture 19	167
Introduction	167
Invariant subspaces	167
Krylov subspaces	170
Arnoldi decompositions	171

Implicit restarting	173
Deflation	174
Lecture 20	177
The Lanczos algorithm	177
Relation to orthogonal polynomials	179
Golub–Kahan–Lanczos bidiagonalization	180
Lecture 21	183
Linear systems, errors, and residuals	183
Descending to a solution	183
Conjugate directions	185
The method of conjugate gradients	187
Termination	190
Lecture 22	191
Operation counts and storage requirements	191
Conjugate gradients as an iterative method	191
Convergence in the A-norm	191
Monotone convergence in the 2-norm	194
Lecture 23	197
Preconditioned conjugate gradients	197
Preconditioners	199
Incomplete LU preconditioners	201
Lecture 24	205
Diagonally dominant matrices	205
Return to incomplete factorization	210
Iterations, Linear and Nonlinear	213
Lecture 25	215
Some classical iterations	215
Splittings and iterative methods	217
Convergence	218
Irreducibility	218
Splittings of irreducibly diagonally dominant matrices	219
M-matrices and positive definite matrices	221
Lecture 26	223
Linear and nonlinear	223
Continuity and derivatives	224
The fixed-point iteration	225
Linear and nonlinear iterations compared	227
Rates of convergence	227
Newton’s method	228
The contractive mapping theorem	229
Bibliography	233

Introduction 233
Bibliography 233
