Preface xvii

Introduction 1

<b>Chapter 1</b>	<b>Dynamical systems and their linear stability</b>	<b>12</b>
1.1	Dynamics in phase space	12
1.1.1	<i>The group of time evolutions</i>	12
1.1.2	<i>The Poincaré map</i>	13
1.1.3	<i>Hamiltonian systems</i>	14
1.1.4	<i>Billiards</i>	15
1.2	Linear stability and the tangent space	15
1.2.1	<i>The fundamental matrix</i>	15
1.2.2	<i>Lyapunov exponents</i>	16
1.2.3	<i>Decomposition of the tangent space into orthogonal directions</i>	17
1.2.4	<i>Homological decomposition of the multiplicative cocycle</i>	19
1.2.5	<i>The local stretching rates</i>	20
1.2.6	<i>Stable and unstable manifolds</i>	22
1.3	Linear stability of Hamiltonian systems	23
1.3.1	<i>Symplectic dynamics and the pairing rule of the Lyapunov exponents</i>	23
1.3.2	<i>Vanishing Lyapunov exponents and the Lie group of continuous symmetries</i>	23
1.3.3	<i>Hamilton–Jacobi equation and the curvature of the wavefront</i>	25

1.3.4	<i>Elimination of the neutral directions</i>	28
1.3.5	<i>The local stretching rate in <math>f = 2</math> hyperbolic Hamiltonian systems</i>	29
1.4	<i>Linear stability in billiards</i>	31
1.4.1	<i>Some definitions</i>	32
1.4.2	<i>The second fundamental form</i>	33
1.4.3	<i>The tangent space of the billiard</i>	33
1.4.4	<i>Free flight</i>	34
1.4.5	<i>Collision</i>	35
1.4.6	<i>Expanding and contracting horospheres</i>	36
1.4.7	<i>Two-dimensional hard-disk billiards (<math>f = 2</math>)</i>	39
<b>Chapter 2</b>	<b>Topological chaos</b>	<b>43</b>
2.1	<i>Topology of trajectories in phase space</i>	43
2.1.1	<i>Phase portrait and invariant set</i>	43
2.1.2	<i>Critical orbits: stationary points and periodic orbits</i>	44
2.1.3	<i>Nonwandering sets</i>	44
2.1.4	<i>Locally maximal invariant sets and global stability</i>	45
2.1.5	<i>Dense orbits and transitivity</i>	46
2.1.6	<i>Attractors, anti-attractors, and repellers</i>	46
2.2	<i>Hyperbolicity</i>	47
2.2.1	<i>Definition</i>	47
2.2.2	<i>Escape-time functions</i>	49
2.2.3	<i>Anosov and Axiom-A systems</i>	50
2.3	<i>Markov partition and symbolic dynamics in hyperbolic systems</i>	52
2.3.1	<i>Partitioning phase space with stable and unstable manifolds</i>	52
2.3.2	<i>Symbolic dynamics and shift</i>	53
2.3.3	<i>Markov topological shift</i>	55
2.4	<i>Topological entropy</i>	57
2.4.1	<i>Nets and separated subsets</i>	58
2.4.2	<i>Definition and properties</i>	58
2.5	<i>The spectrum of periodic orbits</i>	60
2.5.1	<i>Periodic orbits and the topological zeta function</i>	60
2.5.2	<i>Prime periodic orbits and fixed points</i>	61
2.5.3	<i>How to order a sum over periodic orbits?</i>	63
2.5.4	<i>The topological entropy of a hyperbolic invariant set</i>	64
2.6	<i>The topological zeta function of hyperbolic systems</i>	64

2.6.1	<i>The topological zeta function for a nonoverlapping partition</i>	65
2.6.2	<i>The topological zeta function for an overlapping partition</i>	65
<b>Chapter 3</b>	<b>Liouvillian dynamics</b>	67
3.1	Statistical ensembles	67
3.2	Time evolution of statistical ensembles	68
3.2.1	<i>Liouville equation</i>	68
3.2.2	<i>Frobenius–Perron and Koopman operators</i>	69
3.2.3	<i>Boundary conditions</i>	70
3.3	Invariant measures	72
3.3.1	<i>Definition</i>	72
3.3.2	<i>Selection of an invariant measure</i>	73
3.3.3	<i>The basic invariant measures of Hamiltonian systems</i>	74
3.4	Correlation functions and spectral functions	75
3.5	Spectral theory on real frequencies	76
3.5.1	<i>Spectral decomposition on a Hilbert space</i>	76
3.5.2	<i>Purely discrete real spectrum</i>	77
3.5.3	<i>Continuous real spectrum</i>	78
3.5.4	<i>Continuous real spectrum and the Wiener–Khinchin theorem</i>	81
3.5.5	<i>Continuous real spectrum and Gaussian fluctuations</i>	82
3.6	Spectral theory on complex frequencies or resonance theory	83
3.6.1	<i>Analytic continuation to complex frequencies</i>	83
3.6.2	<i>Singularities as a spectrum of generalized eigenvalues</i>	87
3.6.3	<i>Definition of a trace</i>	91
3.7	Resonances of stationary points	94
3.7.1	<i>Trace formula and eigenvalues</i>	94
3.7.2	<i>Eigenstates and spectral decompositions</i>	96
3.7.3	<i>Hamiltonian stationary point of saddle type</i>	100
3.8	Resonances for hyperbolic sets with periodic orbits	103
3.8.1	<i>Trace formula</i>	103
3.8.2	<i>The Selberg–Smale Zeta function</i>	105
3.8.3	<i>Formulation of the eigenvalue problem</i>	110
3.8.4	<i>Fredholm determinant</i>	113
3.8.5	<i>Fredholm theory for the eigenstates</i>	114
3.8.6	<i>Periodic-orbit averages of observables</i>	116
3.9	Resonance spectrum at bifurcations	118

3.9.1	<i>Pitchfork bifurcation</i>	119
3.9.2	<i>Hopf bifurcation</i>	120
3.9.3	<i>Homoclinic bifurcation in a two-dimensional flow</i>	122
3.10	<i>Liouvillian dynamics of one-dimensional maps</i>	123
<b>Chapter 4</b>	<b>Probabilistic chaos</b>	<b>126</b>
4.1	<i>Dynamical randomness and the entropy per unit time</i>	126
4.1.1	<i>A model of observation</i>	127
4.1.2	<i>Information redundancy and algorithmic complexity</i>	128
4.1.3	<i>Kolmogorov–Sinai entropy per unit time</i>	130
4.2	<i>The large-deviation formalism</i>	131
4.2.1	<i>Separated subsets</i>	132
4.2.2	<i>Topological pressure and the dynamical invariant measures</i>	132
4.2.3	<i>Pressure functions based on the Lyapunov exponents</i>	135
4.2.4	<i>Entropy function and Legendre transform</i>	136
4.3	<i>Closed hyperbolic systems</i>	138
4.3.1	<i>The microcanonical measure as a Sinai–Ruelle–Bowen dynamical measure</i>	138
4.3.2	<i>The pressure function for closed systems</i>	140
4.3.3	<i>Generating functions of observables and transport coefficients</i>	141
4.4	<i>Open hyperbolic systems</i>	142
4.4.1	<i>The nonequilibrium invariant measure of the repeller</i>	143
4.4.2	<i>Connection with the dynamical invariant measure and the pressure function</i>	145
4.4.3	<i>Fractal repellers in two-degrees-of-freedom systems and their dimensions</i>	148
4.5	<i>Generalized zeta functions</i>	152
4.5.1	<i>Frobenius–Perron operators in the large-deviation formalism</i>	152
4.5.2	<i>The topological pressure as an eigenvalue</i>	154
4.6	<i>Probabilistic Markov chains and lattice gas automata</i>	156
4.6.1	<i>Markov chain models</i>	156
4.6.2	<i>Isomorphism between Markov chains and area-preserving maps</i>	157
4.6.3	<i>Repellers of Markov chains</i>	159
4.6.4	<i>Large-deviation formalism of Markov chains</i>	161

4.7	Special fractals generated by uniformly hyperbolic maps	163
4.7.1	<i>Condition on the mean sojourn time in a domain</i>	163
4.7.2	<i>Fractal repeller generated in trajectory reconstruction</i>	167
4.8	Nonhyperbolic systems	169
<b>Chapter 5</b>	<b>Chaotic scattering</b>	<b>171</b>
5.1	Classical scattering theory	171
5.1.1	<i>Motivations</i>	171
5.1.2	<i>Classical scattering function and time delay</i>	172
5.1.3	<i>The different types of trajectories</i>	174
5.1.4	<i>Scattering operator for statistical ensembles</i>	176
5.2	Hard-disk scatterers	176
5.2.1	<i>Generalities</i>	176
5.2.2	<i>The dynamics</i>	177
5.2.3	<i>The Birkhoff mapping</i>	179
5.2.4	<i>The one-disk scatterer</i>	180
5.2.5	<i>The two-disk scatterer</i>	181
5.2.6	<i>The three-disk scatterer</i>	183
5.2.7	<i>The four-disk scatterer</i>	201
5.3	Hamiltonian mapping of scattering type	210
5.3.1	<i>Definition of the model</i>	210
5.3.2	<i>Metamorphoses of the phase portraits</i>	211
5.3.3	<i>Characteristic quantities of the chaotic repeller</i>	215
5.4	Application to the molecular transition state	216
5.4.1	<i>Model of photodissociation of <math>\text{HgI}_2</math></i>	216
5.4.2	<i>Transition from a periodic to a chaotic repeller</i>	218
5.4.3	<i>Three-branched Smale repeller and its characterization</i>	219
5.5	Further applications of chaotic scattering	221
<b>Chapter 6</b>	<b>Scattering theory of transport</b>	<b>224</b>
6.1	Scattering and transport	224
6.2	Diffusion and chaotic scattering	225
6.2.1	<i>Large scatterers and the diffusion equation</i>	225
6.2.2	<i>Escape-time function and escape rate</i>	226
6.2.3	<i>Phenomenology of the escape process</i>	229
6.2.4	<i>The escape-rate formula for diffusion</i>	231
6.3	The periodic Lorentz gas	234

6.3.1	<i>Definition</i>	234
6.3.2	<i>The Liouville invariant measure</i>	235
6.3.3	<i>Finite and infinite horizons</i>	236
6.3.4	<i>Chaotic properties of the infinite Lorentz gas</i>	237
6.3.5	<i>The open Lorentz gas</i>	244
6.4	<i>The multibaker mapping</i>	250
6.4.1	<i>Definition</i>	250
6.4.2	<i>The Pollicott–Ruelle resonances and the escape-rate formula</i>	254
6.5	<i>Escape-rate formalism for general transport coefficients</i>	257
6.5.1	<i>General context</i>	257
6.5.2	<i>Transport coefficients and their Helfand moments</i>	258
6.5.3	<i>Generalization of the escape-rate formula</i>	261
6.6	<i>Escape-rate formalism for chemical reaction rates</i>	264
6.6.1	<i>Nonequilibrium thermodynamics of chemical reactions</i>	265
6.6.2	<i>The master equation approach</i>	266
6.7	<i>Discussion</i>	268
6.7.1	<i>Summary</i>	268
6.7.2	<i>Further applications of the escape-rate formalism</i>	269
6.7.3	<i>Relation to the thermostatted-system approach</i>	270
6.7.4	<i>The escape-rate formalism in the presence of external forces</i>	272
<b>Chapter 7</b>	<b><i>Hydrodynamic modes of diffusion</i></b>	<b>275</b>
7.1	<i>Hydrodynamics from Liouvillian dynamics</i>	275
7.1.1	<i>Historical background and motivation</i>	275
7.1.2	<i>Pollicott–Ruelle resonances and quasiperiodic boundary conditions</i>	276
7.2	<i>Liouvillian dynamics for systems symmetric under a group of spatial translations</i>	278
7.2.1	<i>Introduction</i>	278
7.2.2	<i>Suspended flows of infinite spatial extension</i>	279
7.2.3	<i>Assumptions on the properties of the mapping</i>	282
7.2.4	<i>Invariant measures</i>	283
7.2.5	<i>Time-reversal symmetry</i>	284
7.2.6	<i>The Frobenius–Perron operator on the infinite lattice</i>	284
7.2.7	<i>Spatial Fourier transforms</i>	285
7.2.8	<i>The Frobenius–Perron operators in the wavenumber subspaces</i>	286

7.2.9	<i>Time-reversal symmetry for the <math>\mathbf{k}</math>-components</i>	288
7.2.10	<i>Reduction to the Frobenius–Perron operator of the mapping</i>	289
7.2.11	<i>Eigenvalue problem and zeta function</i>	289
7.2.12	<i>Consequences of time-reversal symmetry on the resonances</i>	291
7.2.13	<i>Relation to the eigenvalue problem for the flow</i>	292
7.3	<i>Deterministic diffusion</i>	293
7.3.1	<i>Introduction</i>	293
7.3.2	<i>Mean drift</i>	294
7.3.3	<i>The first derivative of the eigenstate with respect to the wavenumber</i>	295
7.3.4	<i>Diffusion matrix</i>	296
7.3.5	<i>Higher-order diffusion coefficients</i>	297
7.3.6	<i>Eigenvalues and the Van Hove function</i>	299
7.3.7	<i>Periodic-orbit formula for the diffusion coefficient</i>	302
7.3.8	<i>Consequences of the lattice symmetry under a point group</i>	303
7.4	<i>Deterministic diffusion in the periodic Lorentz gas</i>	305
7.4.1	<i>Properties of the infinite Lorentz gas</i>	305
7.4.2	<i>Diffusion and its dispersion relation</i>	309
7.4.3	<i>Cumulative functions of the eigenstates</i>	310
7.5	<i>Deterministic diffusion in the periodic multibaker</i>	312
7.5.1	<i>Properties of the periodic multibaker</i>	312
7.5.2	<i>The Frobenius–Perron operator and its Pollicott–Ruelle resonances</i>	313
7.5.3	<i>Generalized spectral decomposition</i>	316
7.5.4	<i>Analysis of the associated one-dimensional map</i>	318
7.5.5	<i>The root states of the two-dimensional map</i>	326
7.6	<i>Extensions to the other transport processes</i>	334
7.6.1	<i>Gaussian fluctuations of the Helfand moments</i>	334
7.6.2	<i>The minimal models of transport</i>	336
7.6.3	<i>Viscosity and self-diffusion in two-particle fluids</i>	337
7.6.4	<i>Spontaneous symmetry breaking and Goldstone hydrodynamic modes</i>	339
7.7	<i>Chemio-hydrodynamic modes</i>	340

<b>Chapter 8</b>	<b>Systems maintained out of equilibrium</b>	<b>343</b>
8.1	Nonequilibrium systems in Liouvillian dynamics	343
8.2	Nonequilibrium steady states of diffusion	345
8.2.1	<i>Phenomenological description of the steady states</i>	345
8.2.2	<i>Deterministic description of the steady states</i>	346
8.3	From the hydrodynamic modes to the nonequilibrium steady states	350
8.3.1	<i>From the eigenstates to the nonequilibrium steady states</i>	350
8.3.2	<i>Microscopic current and Fick's law</i>	352
8.3.3	<i>Nonequilibrium steady states of the periodic Lorentz gas</i>	353
8.3.4	<i>Nonequilibrium steady states of the periodic multibaker</i>	355
8.3.5	<i>Nonequilibrium steady states of the Langevin process</i>	359
8.4	From the finite to the infinite multibaker	361
8.5	Generalization to the other transport processes	366
8.6	Entropy production	368
8.6.1	<i>Irreversible thermodynamics and the problem of entropy production</i>	370
8.6.2	<i>Comparison with deterministic schemes</i>	371
8.6.3	<i>Open systems and their Poisson suspension</i>	373
8.6.4	<i>The <math>\varepsilon</math>-entropy</i>	376
8.6.5	<i>Entropy production in the multibaker map</i>	378
8.6.6	<i>Summary</i>	383
8.7	Comments on far-from-equilibrium systems	385
<b>Chapter 9</b>	<b>Noises as microscopic chaos</b>	<b>387</b>
9.1	Differences and similarities between noises and chaos	387
9.2	$(\varepsilon, \tau)$ -entropy per unit time	390
9.2.1	<i>Dynamical processes</i>	390
9.2.2	<i>Entropy of a process over a time interval <math>T</math> and a partition <math>\mathcal{C}</math></i>	391
9.2.3	<i>Partition <math>(\varepsilon, \tau)</math>-entropy per unit time</i>	392
9.2.4	<i>Cohen-Procaccia <math>(\varepsilon, \tau)</math>-entropy per unit time</i>	393
9.2.5	<i>Shannon-Kolmogorov <math>(\varepsilon, \tau)</math>-entropy per unit time</i>	394
9.3	Time random processes	397
9.3.1	<i>Deterministic processes</i>	397
9.3.2	<i>Bernoulli and Markov chains</i>	398
9.3.3	<i>Birth-and-death processes</i>	399
9.3.4	<i>Time-discrete, amplitude-continuous random processes</i>	402

9.3.5	<i>Time- and amplitude-continuous random processes</i>	406
9.3.6	<i>White noise</i>	411
9.3.7	<i>Lévy flights</i>	411
9.3.8	<i>Classification of the time random processes</i>	412
9.4	<i>Spacetime random processes</i>	415
9.4.1	<i>(<math>\varepsilon, \tau</math>)-entropy per unit time and volume</i>	415
9.4.2	<i>Deterministic cellular automata</i>	415
9.4.3	<i>Lattice gas automata</i>	416
9.4.4	<i>Coupled map lattices</i>	416
9.4.5	<i>Nonlinear partial differential equations</i>	417
9.4.6	<i>Stochastic spin dynamics</i>	417
9.4.7	<i>Spacetime Gaussian fields</i>	417
9.4.8	<i>Sporadic spacetime random processes</i>	418
9.4.9	<i>Classification of spacetime random processes</i>	419
9.5	<i>Random processes of statistical mechanics</i>	419
9.5.1	<i>Ideal gases</i>	420
9.5.2	<i>The Lorentz gases and the hard-sphere gases</i>	424
9.5.3	<i>The Boltzmann–Lorentz process</i>	425
9.6	<i>Brownian motion and microscopic chaos</i>	429
9.6.1	<i>Hamiltonian and Langevin models of Brownian motion</i>	429
9.6.2	<i>A lower bound on the positive Lyapunov exponents</i>	430
9.6.3	<i>Some conclusions</i>	431
<b>Chapter 10</b>	<b>Conclusions and perspectives</b>	<b>433</b>
10.1	<i>Overview of the results</i>	433
10.1.1	<i>From dynamical instability to statistical ensembles</i>	433
10.1.2	<i>Dynamical chaos</i>	438
10.1.3	<i>Fractal repellers and chaotic scattering</i>	441
10.1.4	<i>Scattering theory of transport</i>	442
10.1.5	<i>Relaxation to equilibrium</i>	442
10.1.6	<i>Nonequilibrium steady states and entropy production</i>	447
10.1.7	<i>Irreversibility</i>	448
10.1.8	<i>Possible experimental support for the hypothesis of microscopic chaos</i>	451
10.2	<i>Perspectives and open questions</i>	452
10.2.1	<i>Extensions to general and dissipative dynamical systems</i>	453

10.2.2	<i>Extensions in nonequilibrium statistical mechanics</i>	454
10.2.3	<i>Extensions to quantum-mechanical systems</i>	456
