Satellite-to-ground radiowave propagation

Theory, practice and system impact at frequencies above 1 GHz

J E Allnutt

Contents

Preface ix

1 Radiowave earth–space communication 1
1.1 Introduction 1
1.2 Artificial earth satellites 2
1.2.1 Choice of orbit 3
1.2.2 Choice of antenna 6
1.2.3 Choice of frequency 10
1.2.4 Choice of polarisation 10
1.2.5 Choice of tracking 13
1.2.6 Choice of service 16
1.3 The atmosphere 16
1.3.1 Atmospheric divisions 16
1.3.2 Weather patterns 17
1.3.3 Rain structures 25
1.3.4 Precipitation types 32
1.3.5 Rainfall characteristics 32
1.4 System planning 46
1.4.1 Earth-station co-ordination 46
1.4.2 Site shielding 50
1.4.3 Link budget 51
1.5 References 54

2 Ionospheric effects 58
2.1 Introduction 58
2.2 Some basic formulations 63
2.2.1 Critical frequency 63
2.2.2 Total electron content 65
2.2.3 Faraday rotation 67
2.2.4 Group delay 69
2.2.5 Phase advance 70
2.2.6 Doppler frequency 70
2.2.7 Dispersion 71
2.3 Ionospheric scintillation 71
2.3.1 Fresnel zone 72
2.3.2 Observations of gigahertz ionospheric scintillations 73
2.3.3 Scintillation indices 73
2.3.4 Power spectra 77

2.4 Ionospheric scintillation characteristics 80
2.5 Theory and predictive modelling of gigahertz ionospheric scintillations 82
2.5.1 Summary of current theories 82
2.5.2 An approach to an engineering model 85
2.6 System impact 85
2.6.1 Amplitude effects 87
2.6.2 Phase effects 91
2.6.3 System effects 94
2.7 References 95

3 Clear-air effects 98
3.1 Introduction 98
3.2 Refractive effects 99
3.2.1 Refractive index 99
3.2.2 Variations of refractivity with height 100
3.2.3 Ray bending 102
3.2.4 Defocusing 104
3.2.5 Angle of arrival and multipath effects 106
3.2.6 Antenna gain reduction 109
3.2.7 Phase advance 110
3.3 Reflective effects 111
3.3.1 Reflection from a smooth surface 112
3.3.2 Reflection from rough surfaces 115
3.4 Absorptive effects 116
3.4.1 Oxygen and water vapour resonance lines 117
3.4.2 Gaseous absorption 118
3.4.3 Attenuation in fog 123
3.5 Tropospheric scintillation effects 125
3.5.1 Drift measurements 126
3.5.2 High latitude measurements 127
3.5.3 Spectral analyses 129
3.5.4 Separation of 'wet' and 'dry' tropospheric scintillations 130
3.5.5 Maritime mobile communications 130
3.5.6 Tropospheric scintillation characteristics 135
3.6 Theory and predictive modelling of clear-air effects 137
3.6.1 Summary of current theories on tropospheric scintillation 138
3.6.2 Two approaches to an engineering model for the prediction of tropospheric scintillation amplitude 140
3.7 System impact 144
3.7.1 Phase effects 144
3.7.2 Amplitude effects 144
3.7.3 System effects 147
3.8 References 148

4 Attenuation effects 153
4.1 Introduction 153
4.1.1 Scattering and absorption 154
4.1.2 Power law relationship 156
4.1.3 Multiple scattering effects 163
4.1.4 Sky noise temperature 163
4.2 Measurement techniques 165
4.2.1 Raingauge measurements 165
4.2.2 Radiometer measurements 168

4.2.3 Satellite beacon measurements 177
4.2.4 Radar measurements 181
4.3 Experimental results 191
4.3.1 Radiometer experiments 191
4.3.2 Radar experiments 192
4.3.3 Satellite beacon experiments 192
4.4 Variability of path attenuation in space and time 193
4.4.1 Cumulative statistics 194
4.4.2 Worst month 199
4.4.3 Short-term characteristics 201
4.4.4 Site-to-site variability 206
4.5 Correlation of attenuation data 216
4.5.1 Long-term scaling of attenuation with frequency 217
4.5.2 Short-term frequency scaling 220
4.5.3 Correlation between experimental techniques 224
4.5.4 Differential effects 225
4.6 Attenuation prediction models 229
4.6.1 Single-site prediction models 229
4.6.2 Site diversity prediction models 233
4.7 System impact 236
4.7.1 Uplink fade margin 236
4.7.2 Downlink degradation 238
4.7.3 Service quality 240
4.8 References 241

5 Depolarisation effects 249
5.1 Introduction 249
5.2 Basic hydrometeor depolarisation considerations 251
5.2.1 Medium anisotropy: Differential effects 251
5.2.2 Tilting and canting angles 255
5.2.3 Cross-polarisation discrimination (XPD) and cross-polarisation isolation (XPI) 260
5.3 Measurement techniques 261
5.3.1 Basic theory 261
5.3.2 Direct measurements 262
5.3.3 Indirect measurements 269
5.4 Experimental results 271
5.4.1 Identifying the problem 271
5.4.2 Early slant-path results 272
5.4.3 Variability of path depolarisation in space and time 278
5.4.4 Worst month 281
5.4.5 Short-term characteristics 282
5.4.6 Site-to-site variability 286
5.5 Correlation of XPD data 290
5.5.1 Long-term frequency scaling 290
5.5.2 Short-term frequency scaling 292
5.5.3 Correlation of attenuation and depolarisation 297
5.6 Depolarisation prediction models 299
5.6.1 Rain depolarisation models 300
5.6.2 Ice depolarisation models 302
5.6.3 General CCIR depolarisation model 303
5.6.4 Joint attenuation versus XPD prediction models 305

5.7 System impact 310
5.7.1 Co-channel interference 310
5.7.2 Scintillation/depolarisation impact 311
5.8 References 314

6 Terrain, multipath and other particulate effects 319
6.1 Terrain effects 319
6.1.1 Knife-edge diffraction 320
6.2 Multipath effects 323
6.2.1 Maritime mobile communications 323
6.2.2 Aeronautical mobile communications 327
6.2.3 Variability in space and time of mobile multipath effects 330
6.2.4 Prediction models 334
6.2.5 System effects 336
6.3 Other particulate effects 338
6.3.1 Range of particles 338
6.3.2 Sand and dust effects 339
6.4 References 349

7 Restoration of performance during signal impairments 352
7.1 Introduction 352
7.2 Ionospheric scintillation effects 353
7.2.1 Ionospheric amplitude scintillation amelioration 353
7.2.2 Faraday rotation amelioration 355
7.3 Tropospheric scintillation effects 356
7.3.1 Ameliorating the refractive effects 357
7.3.2 Ameliorating the multipath effects 357
7.4 Maritime multipath effects 357
7.4.1 Frequency diversity 357
7.4.2 Height/space diversity 358
7.4.3 Polarisation-shaping antennas 358
7.4.4 Beam-shaping antennas 358
7.5 Rain attenuation effects 359
7.5.1 Fixed resource allocation to counteract signal attenuation 361
7.5.2 Dynamic resource allocation to counteract signal attenuation 363
7.5.2.1 Earth-based allocation 363
7.5.2.2 Satellite-based allocation 374
7.5.2.3 On-board processing 380
7.6 Depolarisation effects 381
7.6.1 Techniques below 10 GHz 381
7.6.2 Techniques above 10 GHz 383
7.7 Interference 384
7.7.1 General representation 385
7.7.2 Sidelobe interference 385
7.7.3 Mainlobe (mainbeam) interference 387
7.8 Procedures for automated analysis 391
7.9 References 392

Appendix 1 Terms and definitions relating to space radiocommunications 396
Appendix 2 Useful general equations 406
A2.1 Equations that appear in the text or are referred to in the text 406
A2.2 Calculation of the elevation and azimuth angles of an earth station operating to a geostationary satellite 411
A2.3 Some useful constants 413
