Theory of Atomic Photoionization. By Professor Dr. ANTHONY F. STARACE, Behlen Laboratory of Physics, Department of Physics and Astronomy, The University of Nebraska, Lincoln, NE 68588 (USA). (With 40 Figures) 1

1. Introduction 1

I. General considerations 5

2. Introduction 5
3. Derivation of the general cross-section formula 6
4. The final-state wave function 7
5. Alternative expressions for the transition matrix element 23
6. Cross-section formulae in terms of the final-state channel wave functions 29
7. The angular distribution asymmetry parameter 31
8. The atomic oscillator strength 33
9. Limiting cases and approximations to the general formulae 36

II. The central potential model and its predictions 40

10. The central potential model 40
11. Predictions for the high-energy behavior of the cross section 42
12. Predictions for the near-threshold behavior of the cross section . . . 46
13. Bibliographic note on central potential model calculations 58

III. General methods for including electron correlation 59

a) Whole-space correlation theories 59
14. Introduction 59
15. Configuration interaction in the continuum 60
16. Procedures derived from a variational principle 66
17. Many-body perturbation theory 68
18. The random-phase approximation 75

b) Partitioned-space correlation theories 85
19. Introduction 85
20. Quantum defect theory 86
21. The *R* matrix theory 94
22. Discrete basis-set methods 100

IV. Specialized topics in the theory of photoionization 101

23. Photoelectron angular distributions 101
24. Multiple photoionization 113

Atomic Photoionization. By Professor Dr. JAMES A.R. SAMSON, Behlen Laboratory of Physics, Department of Physics and Astronomy, The University of Nebraska, Lincoln, NE 68588 (USA). (With 75 Figures) 123

1. Introduction 123
2. Historical Review 124

I. Absorption of radiation . . . 129
3. General concepts . . . 129
4. Error analysis . . . 134
II. Experimental techniques . . . 136
5. Light sources . . . 136
α) DC glow discharge . . . 137
β) Spark discharge . . . 138
γ) Synchrotron radiation . . . 140
6. Monochromators and spectrographs . . . 143
7. Absorption and photoionization cells . . . 145
α) Double beam . . . 145
β) Split beam . . . 146
γ) Double ion chamber . . . 147
δ) Heat pipes . . . 149
ε) Atomic beams . . . 152
8. Branching-ratio studies . . . 152
α) Mass spectrometers . . . 152
β) Electron energy analyzers . . . 153
γ) Ion chambers . . . 159
δ) Fluorescence spectrometry . . . 159
9. Electron-impact "photoionization" . . . 160
III. Photoionization measurements . . . 163
10. Total photoionization cross sections . . . 164
α) The rare gases . . . 164
β) The alkali metals . . . 169
γ) Cross sections of some miscellaneous atoms . . . 173
δ) Ionic- and excited-state atoms . . . 178
11. Partial photoionization cross sections . . . 182
α) Ionization from specific orbitals . . . 184
β) Multiple ionization . . . 193
γ) Angular distribution of photoelectrons . . . 199
12. Summary of atoms studied and the future . . . 208
General references . . . 212

Photoelectron Spectroscopy. By Dr. HANS SIEGBAHN, Docent of Physics and Dr. LEIF KARLSSON, Docent of Physics, Institute of Physics, University of Uppsala, S-75121 Uppsala 1 (Sweden). (With 139 Figures) . . . 215

I. Introduction . . . 215
1. Scope and abstract . . . 215
2. Historical background . . . 218
II. Experimental procedures and general features of photoelectron spectra . . . 224
3. Photon sources . . . 224
α) Introduction . . . 224
β) X-ray sources. Monochromatization . . . 227
γ) UV-source. Filtering and polarization . . . 234
δ) Synchrotron radition . . . 240
4. Electron energy analyzers and detectors . . . 243
α) Introduction . . . 243
β) Dispersive analyzers . . . 244

γ) Nondispersive analyzers . . . 250
δ) Preretardation in dispersive analyzers . . . 252
ε) Electron detection . . . 255
5. Sample preparation procedures . . . 256
α) Vacuum requirements . . . 256
β) Gases . . . 257
γ) Liquids . . . 260
δ) Solids and surfaces . . . 262
6. General features of photoelectron spectra . . . 265
α) Introduction . . . 265
β) Calibration of photoelectron spectra . . . 268
γ) Intensities of photoelectron lines . . . 273
δ) Widths of photoelectron lines . . . 278
7. Theoretical models for photoelectron spectra . . . 283
α) Koopmans' theorem and ΔSCF binding energies . . . 283
β) Correlation in initial and final states . . . 287
γ) Intensities of one-electron and multi-electron transitions . . . 289
δ) Vibrational excitations, Franck-Condon principle . . . 294

III. Atomic photoelectron spectra . . . 296
8. Core electron ionization . . . 296
α) The Ne1s spectrum . . . 296
β) The Xe4s, 4p spectrum . . . 302
9. Valence electron ionization . . . 306
α) Inner valence ionization . . . 306
β) Outer valence ionization . . . 309
10. Tables of electron binding energies and relative multiplet intensities for atoms . . . 315
α) Atomic binding energies . . . 315
β) Relative multiplet intensities for ionization of open shell atoms . . . 328

IV. Core level studies in molecules and condensed matter . . . 337
11. Chemical shifts of core electron lines . . . 337
α) Introduction . . . 337
β) Basic model considerations . . . 339
γ) Orbital energy shifts . . . 341
δ) Ground state potential models (GPM) . . . 343
ε) Core shift models including relaxation . . . 345
ζ) Relations to other experimental data. The thermodynamic model . . . 351
12. Multiple excitations in core ionization of molecules and solids . . . 357
α) Molecular core electron spectra . . . 357
β) Many-electron effects in solid core photoelectron spectra . . . 360
γ) Vibrational excitations in core electron spectra . . . 366
δ) Core line multiplet structure in molecules and solids . . . 376
13. Core electron spectra of molecules on metal surfaces. ESCA diffraction 380

V. Valence level studies in molecules and condensed matter . . . 387
14. General features of molecular valence electron spectra . . . 387
α) Introduction . . . 387
β) Electron binding energies of main bands . . . 389
γ) Intensities of main bands . . . 393
δ) Satellite structure . . . 400
ε) Spin-orbit and Jahn-Teller interactions . . . 403

15. Vibrational and rotational excitations in valence electron spectra . . . 409
α) Vibrational selection rules . . . 409
β) Hot bands . . . 412
γ) Qualitative correspondence between vibrational structure and orbital shapes . . . 412
δ) Calculation of vibrational structure . . . 418
ε) Rotational excitations . . . 422
16. Angular distributions of molecular valence photoelectrons . . . 424
α) General aspects . . . 424
β) Photoelectron energy dependence of the asymmetry parameter . . . 426
γ) Vibrational state dependence of the asymmetry parameter . . . 427
δ) Rotational state dependence of the asymmetry parameter . . . 428
ε) Asymmetry parameters for interpretation of valence spectra . . . 430
17. Molecular structure and bonding . . . 431
α) MO methods for characterization of spectra and correlation with chemical reaction parameters . . . 431
β) Biological molecules . . . 436
γ) Molecular conformations, equilibrium systems and chemical reactions . . . 438
δ) Short-lived species . . . 440
ε) Ionically bonded molecules . . . 442
ζ) Negative ions . . . 444
18. Valence electron studies of single crystals and adsorbates . . . 448
α) Selection rules in photoionization from solids . . . 448
β) Two-dimensional band structures . . . 450
γ) Three-dimensional band structures . . . 452
δ) Angular studies of adsorbates . . . 455
19. Density of states structure from photoelectron spectra . . . 458
α) Solid valence photoelectron spectra in the high photon energy limit 458
β) Metal valence bands . . . 459
γ) Alloy valence bands . . . 461
δ) Formation of valence bands in extended systems . . . 464
Appendix: Graph of electron binding energies for the elements . . . 466

Theory of the Auger Effect. By Dr. TEIJO ÅBERG, Associate Professor of Physics, Helsinki Laboratory of Physics, University of Technology, SF-02150 Espoo 15 (Finland), and Dr. GEORGE HOWAT, Computing Officer, Edinburgh Regional Computing Center, University of Edinburgh, Edinburgh EH9 3J2 (Scotland). (With 14 Figures) . . . 469

Introduction . . . 469

I. A nonrelativistic scattering approach to the decay of inner-shell vacancy states . . . 471
1. Boundary conditions . . . 472
2. Nonresonant multichannel scattering . . . 476
3. Resonant scattering including channel interaction . . . 480
4. Autoionization and the Auger effect as resonance scattering. The concept of nonradiative transitions . . . 483
5. Spontaneous photon emission as resonance scattering . . . 489
6. Final-state photon-electron interactions and additivity of nonradiative and radiative widths . . . 492

II. Nonrelativistic theory of nonradiative transitions 495
7. Central field model and classification of nonradiative transitions . . . 496
8. Many-electron theory and frozen-core approximation 501
α) *LS*-coupling 503
β) Intermediate coupling and configuration interaction 506
γ) *jj* coupling 508
δ) Variational principle and Hartree-Fock method 509
ε) Electrons and holes 513
9. Probability of nonradiative transitions 516
α) *LS*- and *jj*-coupling limit 517
β) Intermediate coupling and configuration interaction 520
γ) The open-shell case 521
δ) Relationship between the intensity and probability 523
10. Beyond the independent-electron frozen-core approximation 524
α) Relaxation 524
β) Interchannel interaction 526
γ) Perturbation approaches to the Auger effect 527

III. Relativistic theory of nonradiative transitions 530
11. Basic Hamiltonian and the electron-electron interaction 531
12. A relativistic nonradiative transition probability 536
13. Intermediate coupling 540

IV. Angular distribution of Auger electrons 543
14. General considerations 544
α) Photoionization 547
β) Ionization by high-energy electron impact 548
15. Auger electron angular distributions 549
α) Noncoincidence experiments 549
β) Some features of noncoincidence angular distributions 553
γ) Coincidence experiments 554

V. The calculation of nonradiative transition energies 555
16. General aspects of hole-state and binding energies 556
α) The level shift 556
β) Variational collapse 557
γ) Perturbation analysis of binding energies 560
δ) Relativistic and quantum-electrodynamical effects 562
ε) Correlation 565
17. Semiempirical treatments 566
18. Ab initio calculations 574
α) Self-consistent-field methods 574
β) Correlation effects 578

VI. The calculation of nonradiative transition amplitudes 581
19. Computation of radial wave functions 582
α) The nonrelativistic treatment 582
β) Some approximate potential methods 583
γ) The relativistic treatment 587
δ) Some practical considerations 589
20. On factors affecting the nonradiative transition amplitudes 593
α) Relativistic effects 593
β) The choice of the local potential and kinetic energy 598

γ) The effect of bound orbital basis set and relaxation 600
δ) Correlation effects 604

Appendices

A. Some formulae for the treatment of the continuous spectrum 608
B. Relationship between the configuration interaction and the projection operator approach in the theory of resonances 610
C. A derivation of the Fano profile from scattering theory 613
D. Equivalence of electron and hole wave functions with respect to symmetry 615
E. Conversion and normalization factors 617
