Contents

1	GENERAL OUTLINE OF ULTRASONIC MOTORS	1
1.1	Definition and history of ultrasonic motors	1
1.2	Features of ultrasonic motors, and social requirements	4
	References	7
2	PRINCIPLES OF OPERATION AND CLASSIFICATION OF ULTRASONIC MOTORS	8
2.1	Operating principle	8
2.2	Forming elliptical displacement motion	9
2.3	Methods of producing elliptical displacement motion	10
2.3.1	Use of a flexural progressive wave	10
2.3.2	Excitation by rotation of resonance modes	17
2.4	Similarities to electromagnetic motors	22
2.4.1	Realization of single-phase drive	23
2.4.2	Extension to three-phase (multiphase) drive of a disk vibrator	24
2.5	Arrangement for magnification of displacement and its operation	25
2.6	Construction of ultrasonic motors by combination of resonance modes	27
2.7	Classification of ultrasonic motors	29
2.7.1	Classification by operating principle	29
2.7.2	Classification by motor construction	32
2.7.3	Classification by motor function	33
	References	33
3	ROTARY MOTORS. PART 1: DISK- OR RING-TYPE MOTORS	35
3.1	Ultrasonic motors using bimodal resonance rotation of flexural vibration	35
3.1.1	Resonance modes of flexural (bending) vibration perpendicular to a disk vibrator	35
3.1.2	Comparison of B_{1n} -mode motors	38
3.1.3	Actual disk motors using B_{1n} modes	44
3.1.4	The B_{0n} -mode circular-ring motor	46
3.1.5	Ultrasonic motors using non-axisymmetric vibrations of a disk	59
3.2	Ultrasonic motors using non-rotating resonance modes	74
3.2.1	Single-phase-drive ultrasonic motor	74
3.2.2	Radial-flexural mode annular plate motor	84
3.2.3	Motors using a single resonance mode vibrator	86
	References	91
4	ROTARY MOTORS. PART 2: ROD- OR PLATE-TYPE MOTORS	93
4.1	Longitudinal-torsional mode motors	93
4.1.1	Principle and transducer	93

4.1.2	Hybrid transducer-type motor	94
4.1.3	Degenerate-mode motors	104
4.2	Mode-conversion motors	112
4.2.1	Principle	112
4.2.2	Prototypes and their characteristics	113
4.2.3	Discussion	115
4.3	Single-resonance vibrator, combination-type motors	116
4.3.1	Motors with one vibrator revolving	117
4.3.2	Sandwiched-rotor motors	118
4.4	Flexural-flexural double-mode motors	121
4.4.1	Flexural double-mode bar motor	121
4.4.2	Flexural double-mode cylindrical motor	128
4.5	Rectangular plate motors	131
4.5.1	Longitudinal-flexural-mode plate motor	131
4.5.2	Flexural-flexural-mode plate motor	152
	References	152
5	LINEAR MOTORS	154
5.1	General	154
5.2	Non-self-moving linear motors	154
5.2.1	Travelling-wave motor using flexural wave	154
5.2.2	Linear motor driven by layered piezoelectric ceramics	168
5.3	Self-moving linear motors	174
5.3.1	Hybrid transducer-type motor with longitudinal vibrator	174
5.3.2	Hybrid transducer-type motor using flexural vibrator	179
5.3.3	π -Shaped transducer-type motor	180
5.3.4	Flexural-flexural double-mode bar motor	185
5.3.5	(R, 1)-((1, 1))-mode annular plate motor	189
5.3.6	Longitudinal-flexural double-mode rectangular plate motor	191
	References	196
6	APPLICATIONS OF ULTRASONIC MOTORS	197
6.1	General applications	197
6.2	Applications in the autofocus mechanism of cameras	198
6.3	Application to the drive of a watch	203
6.3.1	A watch motor using a flexural B_{03} -mode disk	203
6.3.2	Driving and controlling a stepping ultrasonic motor	205
6.4	Application to a card-forwarding device	213
6.4.1	Device using a flexural double-mode bar motor	213
6.4.2	Device using an (R, 1)-((1, 1))-mode annular plate motor	215
6.5	Application to a paper sheet-forwarding device	217
6.5.1	Necessity for a roller to feed paper smoothly	217
6.5.2	Main operating element	221
6.5.3	Influence of roller thrust on forwarding characteristics	221
6.5.4	Forwarding force	223
6.5.5	Resonance frequency and electric current	223
6.5.6	Sheet thickness effects	224
6.6	Applications in positioning mechanisms	224
6.6.1	A π -type linear ultrasonic motor	224
6.6.2	Rotational positioning using a hybrid transducer-type motor	229
	References	229

7	DESIGN OF ULTRASONIC MOTORS	231
7.1	Introduction	231
7.2	Equivalent circuit and motor characteristics	231
7.2.1	Equivalent circuit	231
7.2.2	Characteristics	234
7.3	Design procedure	238
7.3.1	Design of torque and speed	238
7.3.2	Size of motor and maximum torque	240
7.3.3	Design of resonance of longitudinal vibration system	240
7.4	Transient responses and measurement	244
7.4.1	Transient responses	244
7.4.2	Estimation of motor characteristics from transient responses	247
7.5	Friction at the contact surface	248
7.5.1	Friction in ultrasonic motors	248
7.5.2	Lubrication of the contact surface	249
	References	252
	APPENDICES	253
A1	Equivalent circuits of piezoelectric vibrators	253
A1.1	Piezoelectric vibrator and its fundamental equations	253
A1.2	Equivalent circuits	255
A1.3	Longitudinal vibrator (transducer) using multilayer piezoelectric ceramics	260
A2	Transducers for ultrasonic motors	261
A2.1	Monomorphic and bimorphic types	261
A2.2	Bolt-clamped Langevin transducers	265
A2.3	Efficiency of transducers	270
A3	Measurement methods	271
A3.1	Measurement of equivalent-circuit elements of a piezoelectric vibrator at a low level of electrical input	271
A3.2	Measurement of equivalent-circuit elements at a high level of electrical input	273
A3.3	Measurement of the admittance of an ultrasonic motor	277
A3.4	Measurement of vibrational displacement	278
A4	Power supply circuits	282
A4.1	Supply circuit for relatively high-power use	282
A4.2	Pulse driving circuit	286
A5	Frictional materials	288
	References	292
