<b>Preface</b>	<b>vii</b>
<b>Surface Electronic Structure</b>	<b>1</b>
<i>J E Inglesfield</i>	
1. Introduction	2
1.1. Units	4
2. Electronic states at the surface	4
2.1. The Schrödinger equation at the surface	4
2.2. Wavefunctions at the surface	6
2.3. Methods of calculating surface electronic structure	11
3. Surface electronic structure of metals and semiconductors	15
3.1. Surfaces of simple metals	18
3.2. Surfaces of transition metals	24
3.3. Surfaces of semiconductors	35
4. Work functions	44
4.1. Work function variation and surface smoothing	46
4.2. Jellium calculation of work functions	47
5. Surface energy	48
5.1. Surface energy of simple metals	49
5.2. Surface exchange-correlation energy	50
6. Electronic structure and surface crystallography	53
6.1. Relaxation of metal surfaces	53
6.2. Mo and W (001) surface reconstructions	55
6.3. Semiconductor surface reconstructions	56
Acknowledgments	57
References	57
Appendix	62
<b>Photoelectron Spectroscopy of Solids and their Surfaces</b>	<b>71</b>
<i>R H Williams, G P Srivastava and I T McGovern</i>	
1. Introduction	72
2. Basic concepts	73
2.1. The photoemission process	73
2.2. Binding energies and reference levels	75
2.3. Surface effects in the emission process	78
2.4. Surface effects in the excitation process	80
2.5. Photoionisation cross sections	83
2.6. Symmetry selection rules and their limitations	87

3. Experimental	93
3.1. General requirements	93
3.2. Electron energy analysers	94
3.3. Photon sources	95
4. Theoretical methods	97
4.1. The 'three-step model'	97
4.2. Steady-state scattering theory	99
4.3. Response theory of photoemission	100
4.4. Green function methods	102
4.5. Multiple scattering or dynamic approach	104
5. Examples of applications	106
5.1. Layer lattice materials	106
5.2. The electronic structure of metals	109
5.3. Semiconductors	113
5.4. Adsorption on surfaces	117
5.5. Photoelectron diffraction and SEXAFS	120
6. Concluding remarks	122
References	123
Addendum	128

## **X-ray-excited Auger and Photoelectron Spectroscopy** **135**

*P Weightman*

1. Introduction	136
2. xps of core levels	137
2.1. Free atoms: a test of atomic structure calculations	137
2.2. Satellites: breakdown of the independent-particle approximation	141
2.3. Solids: practical considerations	144
2.4. Chemical shifts and extra-atomic relaxation	146
2.5. Core-level shifts for metals	148
2.6. Metals: response of electron gas	151
3. Auger spectra	153
3.1. Auger energies	153
3.2. Auger intensities	156
3.3. L, M and N shell Auger spectra	158
3.4. Coster-Kronig transitions and Auger vacancy satellites	160
4. Core-level widths	162
4.1. Lifetime broadening	165
4.2. Non-lifetime broadening	168
5. Comparison of Auger and xps energy shifts	170
5.1. Chemical applications: the Auger parameter	171
5.2. Application to metallic screening	172
6. Many-electron effects	176
7. Valence levels	179
7.1. Brief survey of xps studies of valence bands	180
7.2. Auger spectra of valence bands	181
8. Conclusions	186
Acknowledgments	187
References	188
