

# CHEMICAL BONDING IN SOLIDS

**JEREMY K. BURDETT**

*The University of Chicago*

*New York Oxford*

OXFORD UNIVERSITY PRESS

1995

# Contents

## Symbols and Abbreviations, xv

### 1. Molecules, 3

- 1.1 The H<sub>2</sub> Molecule: Molecular Orbital Approach, 3
- 1.2 The H<sub>2</sub> Molecule: Localized Approach, 7
- 1.3 Energy Levels of HHe, 9
- 1.4 Energy Levels of Linear Conjugated Molecules, 10
- 1.5 Energy Levels of Cyclic Polyenes, 12
- 1.6 Energy Differences and Moments, 20
- 1.7 The Jahn–Teller Effects, 24

### 2. From molecules to solids, 29

- 2.1 The Solid as a Giant Molecule, 29
- 2.2 Some Properties of Solids from the Band Picture, 38
- 2.3 Two-Atom Cells, 45
- 2.4 The Peierls Distortion, 48
- 2.5 Other One-Dimensional Systems, 52
- 2.6 Second-Order Peierls Distortions, 61

### 3. More details concerning energy bands, 66

- 3.1 The Brillouin Zone, 66
- 3.2 The Fermi Surface, 76
- 3.3 Symmetry considerations, 82

### 4. The electronic structure of solids, 89

- 4.1 Oxides with the NaCl, TiO<sub>2</sub>, and MoO<sub>2</sub> Structures, 89
- 4.2 The Diamond and Zincblende Structures, 96
- 4.3 “Localization” of “Delocalized” Orbitals in Solids, 102
- 4.4 The Structure of NbO, 109
- 4.5 Chemical Bonding in Ionic Compounds, 115
- 4.6 The Transition Metals, 117
- 4.7 The Free- and Nearly-Free-Electron Models, 127
- 4.8 Compounds between Transition Metals and Main Group Elements, 132
- 4.9 The Nickel Arsenide and Related Structures, 134
- 4.10 Molecular Metals, 139
- 4.11 Division into Electronic Types, 142

**5. Metals and insulators, 144**

- 5.1 The Importance of Structure and Composition, 144
- 5.2 The Structures of Calcium and Zinc, 156
- 5.3 Geometrical Instabilities, 157
- 5.4 Importance of Electron–Electron Interactions, 163
- 5.5 Transition Metal and Rare Earth Oxides, 170
- 5.6 Effect of Doping, 176
- 5.7 Superconductivity in the  $C_{60}$  Series, 179
- 5.8 High-Temperature Superconductors, 182

**6. The structures of solids and Pauling's rules, 191**

- 6.1 General Description of Ion Packings, 191
- 6.2 The First Rule, 193
- 6.3 The Second Rule, 200
- 6.4 The Third Rule, 207
- 6.5 The Fifth Rule, 210
- 6.6 The Description of Solids in Terms of Pair Potentials, 211
- 6.7 More about the Orbital Description of Silicates, 216

**7. The structures of some covalent solids, 219**

- 7.1 Electron Counting, 219
- 7.2 Change of Structure with Electron Count, 222
- 7.3 Structures of Some  $AX_2$  Solids, 225
- 7.4 Structures Derived from Simple Cubic or Rocksalt, 228
- 7.5 The Stability of the Rocksalt and Zincblende Structures, 234
- 7.6 The Structures of the Spinel, 239
- 7.7 Distortions of the Cadmium Halide Structure: Jahn–Teller Considerations, 242
- 7.8 Distortions of the Cadmium Halide Structure: Trigonal Prismatic Coordination, 251
- 7.9 Distortions of the Cadmium Halide Structure:  $t_{2g}$  Block Instabilities, 254
- 7.10 The Rutile versus Cadmium Halide versus Pyrite Structures, 264
- 7.11 Second-Order Structural Changes, 266

**8. More about structures, 270**

- 8.1 The Structures of the Elements in Terms of Moments, 270
- 8.2 The Structures of Some Main Group Intermetallic Compounds, 280
- 8.3 The Hume-Rothery Rules, 285
- 8.4 Pseudopotential Theory, 287
- 8.5 The Structures of the First Row Elements, 290

8.6 The Coloring Problem, 291

8.7 Structural Stability and Band Gap, 298
