

The Natural Selection of the Chemical Elements

The Environment and Life's Chemistry

R. J. P. WILLIAMS

*Emeritus Research Professor,
University of Oxford*

and

J. J. R. FRAÚSTO da SILVA

*Professor of Analytical Chemistry, Instituto Superior Técnico,
Universidade Técnica de Lisboa*

CLARENDON PRESS · OXFORD
1996

Contents

List of units of energy and work and the values of some physical constants

xxv

Part I · The principles of the natural selection of chemical elements into physical states and chemical combinations

1	The development of man's ideas concerning nature	3
1.1	The early views	3
1.2	The development of modern views	7
1.3	The periodic table and the electronic structure of atoms	9
1.4	Fields of force	11
1.5	Secondary consequences of (orbital) motion restrictions: shapes of atomic combinations	19
1.6	Fire (energy), temperature and pressure	20
1.7	Light and radiant energy	21
1.8	Fields and flow	23
1.9	Order, disorder and organisation of rest masses	24
1.10	The evolving universe	26
1.11	The limitations to understanding	27
2	Order in chemical systems: elements and their combinations	32
A	Elements and stoichiometric combination of elements	32
2.1	Introduction to chemical binding	33
2.2	The atomic and physical properties of the elements	33
2.2.1	Atomic sizes and structures of the elements	35
2.2.2	Ionisation potential and electron affinity	38
2.2.3	Empirical covalent and van der Waals radii of atoms	42
2.2.4	Shapes of molecules formed from single elements	43
2.2.5	The binding energies of the elements	43
2.2.6	Summary of the properties of the elements and their natural selection	45
2.3	The combination of different elements—stoichiometric and <i>non-stoichiometric compounds</i>	46
2.4	General factors affecting the combination of two different atoms	47
2.4.1	Electronegativity and size	47

2.4.2	Combining ratios—valence	48
2.4.3	Variable valence in A/B compounds	49
2.4.4	Available orbitals: structures	51
2.5	Stoichiometric combination of two similar non-metal atoms	52
2.5.1	Small covalent molecules: electronegativity and charge distribution	53
2.5.2	Shapes of small covalent molecules A_mB_n	53
2.5.3	Bond energy in covalent compounds	58
2.6	Assemblies of molecules: intermolecular forces	59
2.6.1	Hydrogen bonding	61
2.6.2	The formation of liquids: water	61
2.6.3	The different kinds of liquids	62
2.7	Hydrogen in compounds other than water	62
2.8	Summary of the outstanding features of non-metal compounds	63
2.9	Stoichiometric combination of very different elements: ionic compounds	66
2.9.1	Energetics of ionic compounds	66
2.9.2	Physical properties of ionic solids	68
2.9.3	Variable valence and electronic conductivity in salts	68
2.9.4	Partial covalence in ionic compounds: coordination chemistry	69
2.9.5	Ligand-field effects on structure	70
2.9.6	Ligand-field energies	71
B	Non-stoichiometric combination of elements	73
2.10	Introduction	73
2.11	Ternary salts and silicates	73
2.12	Intermediate cases between salts and covalent molecules: covalent solids A_mB_n	75
2.13	Combination of like metal atoms: alloys	76
2.14	Liquids and solutions	77
2.15	Summary of order	77
3	The balance between order and disorder	81
3.1	Introduction	81
3.2	Order–disorder balance	84
3.2.1	Spatial arrangements of the particles of a system	85
3.2.2	Changes in entropy with changes in volume of a gas—configurational entropy	86
3.2.3	Temperature change and disorder—thermal entropy	88
3.2.4	Total entropy change of a system	92
3.2.5	Physical states in balance—latent heats	93
3.3	Systems out of balance	96
3.3.1	Thermodynamics of mixing	98
3.4	Standard states of chemical substances	99
3.4.1	Applications to chemical systems: thermodynamic stability of compounds	102
3.5	Free energy and chemical equilibrium	104
3.5.1	The equilibrium constant at different temperatures or pressures	106
3.5.2	Chemical change and physical change	107

3.6	Energy transfer: work	107
3.6.1	Chemical energy transfer to mechanical energy (pV)	107
3.6.2	Thermodynamic efficiency of transfer of energy: doing work	109
3.7	Radiative energy and entropy	111
3.8	Energy state distribution in materials: the construction of machines	113
3.9	Summary of order/disorder equilibrium	114
4	Phase equilibria	117
4.1	Introduction	117
4.2	Phases and chemicals in equilibrium	118
4.3	The phase rule	120
4.3.1	Chemical equilibria and components of chemical systems	121
4.3.2	The operational definition of component	123
4.3.3	The number of phases	124
4.4	Variability of chemical systems: examples of systems of more than one component	125
4.4.1	Unitary systems	126
4.4.2	Binary systems	127
4.4.3	Ternary systems	132
4.4.4	Systems with more than three components	134
4.4.5	Liquid crystals	135
4.4.6	Summary of phase diagrams	135
4.5	The effects of gravity	137
4.6	The free-energy conditions and phases at equilibrium	137
4.6.1	Stability of phases: free-energy changes with composition	139
4.7	The co-operative character of phase transitions	141
4.8	Supercooled phases—glasses	143
4.9	Summary of equilibrium conditions of phases	144
5	Equilibria in dilute solutions in water	148
5.1	Introduction	148
5.2	Factors that affect solubility generally	149
5.3	Relative solubility in two liquid phases: partition coefficients	152
5.4	Dilute solutions containing more than one solute	153
5.5	Equilibria between acids and bases in aqueous solutions	154
5.5.1	Formation of precipitates: solubility products	157
5.5.2	Complex ion formation	159
5.5.3	Selectivity of precipitation and complex ion formation	163
5.6	Competitive equilibria	165
5.6.1	Proton and hydroxide ion binding	166
5.6.2	Conditional, apparent or effective stability constants	169
5.6.3	Organic molecule associations	171
5.6.4	Organic polymers in solution	171
5.6.5	Summary of solubility and complex association equilibria	172
5.6.6	Acid–base equilibria and components in solutions	174

5.7	Equilibria between oxidation states	174
5.7.1	Oxidation–reduction potentials in water	177
5.7.2	The H_2/O_2 potentials in water at pH = 7.0	180
5.7.3	Metal ion oxidation states at pH = 7.0	181
5.7.4	C, N, O and S oxidation states in aqueous solutions	183
5.7.5	Oxidation states, components and variance	183
5.8	Combined acid–base and redox equilibria	184
5.8.1	Redox potentials and complex ion formation	185
5.8.2	The change from the H_2S/S_n to the H_2O/O_2 potential (or vice versa)	186
5.9	Summary: variance in solutions	188
6	Limited phases, fields and compartments	192
6.1	Introduction	192
6.2	One-component systems of limited volume	195
6.2.1	Sizes of phases	195
6.2.2	Shape of a limited phase alone and in contact with a bulk phase	195
6.2.3	Surfaces and shapes of limited phases as variables	196
6.2.4	Fields between limited phases in equilibrium	197
6.2.5	Assemblies of limited phases	198
6.2.6	Total variables in phase systems of limited volume	199
6.2.7	Factors governing phase interactions in fields: chemical selectivity of surface interactions	199
6.2.8	Matching of shapes of elastic substances at equilibrium	200
6.3	Further diversification through barriers: compartments	201
6.3.1	Storage of free energy between compartments: an ability to do work	201
6.3.2	Pressure and concentration gradients between compartments	202
6.3.3	Chemical potential gradients between compartments	203
6.3.4	Storage of mechanical energy (tension)	203
6.3.5	Energy storage in a gravitational field	204
6.3.6	The natural selection of chemical elements in compartments	205
6.4	Energy storage by dilute components in compartments	205
6.4.1	Osmotic pressure	205
6.4.2	Electrical potential differences	207
6.5	Equivalences of free energies	209
6.6	Radiation energy stored in compartments	210
6.7	Limited phases and compartments in biological systems	210
6.8	Very small phases: large molecules treated as phases	211
6.8.1	'Phase' behaviour of proteins and nucleotides	212
6.8.2	Ordered sequences in polymers and assemblies	214
6.8.3	An example of equilibrium self-assembly: viruses	214
6.9	Summary: the incommensurate increase in variables	215
7	The evolution of kinetic control and of organisation	219
A	Kinetic principles	219
7.1	Introduction	219
7.1.1	Change, time and flow	220
7.2	The initial development in the natural selection of the atomic elements	222

7.3	Factors affecting reaction rates	224
7.3.1	Kinetics and natural selection of chemical elements: functional value in living systems	226
B	Chemical kinetic controls	228
7.4	Chemical barriers to reaction	228
7.4.1	Molecularity and energy requirements	228
7.5	Chemical selection of components for rate control	229
7.5.1	Electron transfer	229
7.5.2	The nature of water: a very special solvent for transport	231
7.5.3	Selected chemical rates of diffusion in water and ion channels: solvent exchange and message transmission	231
7.5.4	The extension of the selectivity of chemical steps of diffusion: message reception and triggering	234
7.5.5	Diversification of element use through non-exchanging binding	236
7.6	Slow exchange, structures and the requirements for catalysts: construction and reaction systems	237
7.6.1	Kinetics of organic compounds in traps	238
7.7	Chemical change in organic molecules	239
7.7.1	Acid–base reactions: hydrolysis and condensation	240
7.7.2	Oxidation/reduction reactions: further reaction systems	243
7.7.3	Two-electron changes	244
7.7.4	Free-radical reactions	245
7.8	Inorganic elements in organic and biological chemistry: <i>summary of kinetic aspects</i>	246
7.8.1	Kinetic selection of the elements for survival	247
7.8.2	Allosteric control of reactions: feedback to catalysts	248
7.8.3	The effect of temperature	249
7.8.4	Control of energy supply: synthesis	249
7.8.5	Control over molecularity	250
7.9	Chemicals and self-assembly of equipment	250
C	Physical barriers	251
7.10	Physical controls over reaction rates	251
7.10.1	Introduction	251
7.10.2	Diffusion in one phase in a single compartment	251
7.10.3	Restricted diffusion across boundaries between compartments	252
7.10.4	Diffusion in media formed by different elements	253
7.10.5	The nature of containing vessels: boundaries	254
7.10.6	Control of diffusion in inorganic phases	255
7.10.7	The flow of water	256
7.10.8	The control of diffusion by organic phases	257
7.11	Functional advantages of an increase in the number of (communicating) compartments	259
7.12	Fields and flow	262
7.12.1	Electronic and electrolytic circuits	263
7.13	From simple flow to feedback control	265
7.13.1	Feedback electronic circuits: an illustration	266
7.13.2	Physical fields and feedback: a biological example	268
7.13.3	Geological control and feedback: the physical water cycle on Earth	269

7.14	Physical control of diffusion and variance of systems	270
7.15	Physical feedback control in relation to chemical component feedback	272
	D Organisation	274
7.16	Linking metabolic change to creation of structure	274
7.17	Nucleation of assemblies	275
7.18	Shape	277
7.19	Energy, radiation fields and flow in temperature gradients	277
	7.19.1 Energy capture and control	278
	7.19.2 Energy flow and shape	281
7.20	Thermodynamics and organisation	281
7.21	Plans and information	282
7.22	Thermodynamic efficiency and the ability to change state	282
7.23	The trapping of energy and the evolution of organisation: a summary	284

Part II · The observed natural selection of chemical elements in both abiotic and biotic systems during their evolution

8	The evolution of inorganic chemicals on Earth	285
8.1	Introduction	285
8.2	The formation of the elements in the universe	290
8.3	The abundance of elements in the universe	291
8.4	The initial formation of compounds and condensates	294
	8.4.1 The affinity of the elements for one another at different temperatures	295
8.5	The formation of Earth	297
	8.5.1 The formation of sulphides	301
	8.5.2 The primitive atmosphere	303
	8.5.3 The nature of the early sea	305
	8.5.4 The early surface of the Earth	306
	8.5.5 Some non-equilibrated inorganic compartments of interest: an aside	308
8.6	The later evolution of the Earth's chemicals	309
	8.6.1 The atmosphere today	310
	8.6.2 The nature of the sea today	311
	8.6.3 The nature of freshwater today	313
	8.6.4 The crust of Earth today	314
	8.6.5 Trace element fractionation in the rocks and soils of the crust	315
	8.6.6 The nature of soils and soil water	315
	8.6.7 Summary of element separation in Earth's compartments today	316
	8.6.8 The elementary composition of living systems	318
	8.6.9 Clays and sulphides: origins of early life?	319
8.7	Conclusion: Earth's evolution	320

9 The evolution of organic compounds	323
9.1 Introduction	324
9.2 The evolution of carbon chemistry: thermodynamics and kinetics	325
9.3 The basic reactions of organic chemistry	327
9.4 Major small organic chemicals: abiotic organic chemistry	328
9.4.1 Saturated linear fatty chains (alkanes)	328
9.4.2 Unsaturated and non-linear C/H chains	330
9.4.3 Substitutional derivatives of C/H compounds	333
9.5 Shapes of organic molecules	337
9.5.1 Handedness within shape: optical activity	337
9.6 A general summary of organic chemical constructions	337
9.7 Basic practices of organic and biological organic chemistry	340
9.7.1 Introduction	340
9.7.2 The apparatus of biological organic chemistry	341
9.8 General introduction to bioorganic chemistry	342
9.8.1 Condensation reactions in bioorganic chemistry	343
9.8.2 Polyfunctional condensation	345
9.8.3 Peptides and proteins	346
9.8.4 Nucleic acids	346
9.8.5 Weak bonds and the folded structures of polymers	350
9.8.6 The properties of folded polymers	352
9.8.7 Summary of condensation reactions	353
9.9 Intermediates: carriers of fragments: cofactors and coenzymes	354
9.10 Driving energy for biological reactions including condensation	354
9.10.1 Introduction	354
9.10.2 Energy from chemicals: disproportionation	355
9.10.3 Initial sources of energy	356
9.11 Phosphorus bioorganic chemistry	357
9.12 Sulphur bioorganic chemistry	359
9.13 Relative thermodynamic and kinetic stability of organic molecules in water	361
9.14 Summary of the origins of acid–base organic chemistry	362
9.15 Organic redox chemistry	363
9.15.1 Redox reactions at low redox potential	365
9.15.2 Organic redox chemistry and sulphur	365
9.15.3 Free-radical reactions and polymerisations	366
9.15.4 A note on selenium organic chemistry	367
9.15.5 Summary of redox organic chemistry	367
9.16 Nature's need for catalysts in organic chemistry	368
9.16.1 Metal organic compounds in biological catalysts	368
9.16.2 Organometallic and co-ordination compounds in organic chemistry	369
9.17 Organic chemicals in condensed phases	371
9.17.1 Introduction	371
9.17.2 Self-assembly of organic molecules	371
9.17.3 The phase rule and organic molecules	372
9.18 Abiotic organic chemical cycles	373
9.19 Summary: the diversity of organic and biological chemistries	374

10	Early biological chemistry: the uptake and incorporation of elements in anaerobic organisms	377
10.1	Introduction	377
10.2	The biological selection of major elements: general introduction	382
10.3	Biological selection of minor elements	384
10.4	Examples of essential functions of inorganic elements	385
10.4.1	Osmotic pressure control	385
10.4.2	Electrical neutrality	386
10.4.3	Cross-linking and precipitation	387
10.4.4	Electronic conduction	388
10.4.5	Catalysis	389
10.4.6	Energy capture—synthesis and gradients	389
10.4.7	Triggering of mechanical action	392
10.4.8	Summary of required elements	392
10.5	Uptake and incorporation mechanisms of the major elements	393
10.5.1	Hydrogen and oxygen uptake and incorporation	394
10.5.2	Uptake and incorporation of carbon and nitrogen: introduction	395
10.5.3	C/H/O incorporation	396
10.5.4	Nitrogen incorporation	399
10.5.5	The uptake and incorporation of sulphur and selenium	400
10.5.6	Interrelationships of C/H/O/N compound incorporation	400
10.5.7	The incorporation of phosphate	401
10.5.8	Final stages of the incorporation of the major elements in polymers	402
10.5.9	Summary of major element incorporation	402
10.6	The uptake and incorporation of electrolytes	404
10.6.1	Introduction to pumps	404
10.6.2	Proton and other ion pumps	406
10.7	Biological centres in proteins for metal ion incorporation	406
10.7.1	Incorporation of metals into cofactors	408
10.7.2	Elements in different oxidation states	408
10.8	Summary of early element uptake and incorporation and of developing functional use	409
10.8.1	Catalysis and metal ions	410
10.8.2	Fitness of individual sites: the entatic state	411
10.8.3	The incorporation of proteins into compartments	411
10.9	Primitive development of energy sources	413
10.10	Summary of uptake and incorporation of elements in anaerobic organisms	414
11	Early cellular organisation in anaerobes	417
11.1	Introduction	417
11.2	Co-operative stability in dissipative systems	419
11.3	The beginning of molecular copying	422
11.3.1	Coded polymers: RNA life	423
11.3.2	Syntheses of matching sequences of different polymers	425
11.3.3	The beginnings of translation	426
11.3.4	The selected elements for the coded polymers	427
11.4	Control and regulation: introduction	428

11.5	Feedback control of element and small molecule concentrations	430
11.5.1	The cell as a chemostat: feedback to pumps	430
11.5.2	Feedback in metabolic pathways of the elements hydrogen, carbon and oxygen	431
11.5.3	Feedback control of the incorporation of the element nitrogen and of amino acid synthesis	432
11.5.4	Feedback control of nucleotides: incorporation into polymers	432
11.5.5	Different pathways for degradation and synthesis in metabolism	434
11.5.6	Phosphate metabolism and its feedback	435
11.5.7	Additional elements in controls over pathways	437
11.6	Redox potential controls	437
11.6.1	Summary of acid–base and redox control	438
11.7	The control of shape: mechanical controls	439
11.7.1	Fields, flow and shape	441
11.7.2	Early mineralisation	442
11.8	Regulation: introduction	443
11.8.1	Phosphate regulation of genes	444
11.8.2	Other examples of regulation by non-metal elements	446
11.8.3	Regulation by metal cations	447
11.8.4	Redox regulation of protein production: sulphur and iron	448
11.8.5	Control plus regulation—an example: nitrogen fixation	448
11.9	The different pathways of polymer synthesis and degradation	451
11.9.1	Cross-talk in regulation	451
11.10	The integration of element chemistry in control and regulation: summary	452
11.11	The cell cycle: introduction	453
11.12	Developmental evolution of anaerobic cells	454
11.12.1	Intracellular vesicles and their membranes	455
11.12.2	Contents of internal vesicles	457
11.13	Symbiosis and differentiation	458
11.14	Summary	459
12	The structure and chemistry of organisms after the advent of dioxygen	463
12.1	Introduction	463
12.2	Developing organisation	470
12.2.1	The geological record of evolution	471
12.2.2	Development of intracellular compartments in aerobic cells	472
12.2.3	The chemical problems of evolution	474
12.3	The introduction of new metabolism	476
12.4	Changing element availability with rising dioxygen partial pressure	478
12.4.1	The chemical and biological reactions to dioxygen increase with time	479
12.4.2	Coevolution of the use of new non-metal compounds and metal elements	484
12.4.3	Energy transduction from dioxygen	484

12.5	New uptake and incorporation of elements	486
12.5.1	The new handling of iron uptake	487
12.5.2	The linking of new iron uptake to phosphate: controls and regulation	488
12.5.3	Iron uptake in higher organisms and its connections	489
12.5.4	The uptake, distribution and incorporation of other elements	489
12.5.5	Changes in the uses of some non-metals	490
12.6	The distribution of elements in compartments	491
12.6.1	Element distribution in eukaryote cells	491
12.7	New small organic compounds	492
12.8	New proteins and enzymes	494
12.9	Metabolite and protein distribution	495
12.10	Putting together cells with filaments: multicellular systems	496
12.11	The redox metabolism outside cells	498
12.12	Biom mineralisation: introduction	499
12.12.1	Biom minerals: examples	500
12.13	Summary	502
13	Organisation in advanced organisms	505
13.1	Introduction	505
13.1.1	Control and regulation: a reminder	507
13.2	The elements in message transmission	508
13.3	Single eukaryotic cells: control and regulation	509
13.3.1	The extended use of calcium as a messenger	511
13.3.2	Phosphate metabolic and signalling changes	513
13.3.3	Messages to mechanical devices	516
13.4	Multicellular organisms	517
13.4.1	Maintained cell shape: single nerve cells	517
13.4.2	The functional shapes of multicellular organisms and communication	519
13.4.3	Extracellular fluids and multicellular communication	520
13.4.4	Zinc and its organic messenger network	525
13.4.5	Summary of acid-base messengers	527
13.4.6	Redox communications: free iron and the new messenger networks	527
13.4.7	Haem iron and the new networks	528
13.4.8	Copper and new messengers	530
13.4.9	Other elements in messenger systems	531
13.5	Interactions between and complexity of messenger systems	532
13.5.1	The integration of element messages in networks	532
13.5.2	Total integration of element functions	535
13.5.3	Organs and their elements	535
13.6	The problem of development	537
13.6.1	Adaptability, differentiation and morphogenesis	538
13.6.2	The problem of the development of an element network	539
13.7	Conclusions concerning the element content of organisms	539
13.8	The brain: a phenotypical organisation centre	543
13.9	Cellular dependencies: genetic management towards an ecosystem	544
13.10	Summary: complexity, management and survival stability	546
13.10.1	The ecosystem and man	547

14	Man's selection of the chemical elements	550
14.1	Introduction	550
14.2	The internal chemistry of man	553
14.3	The evolution of man's industrial inorganic chemistry	557
14.3.1	Inorganic agricultural developments	560
14.3.2	Catalysis and inorganic materials	561
14.3.3	Man's development of energy sources using chemical elements	561
14.3.4	Culture and inorganic materials	564
14.4	The development of industrial organic materials	565
14.5	Organometallic and complex ion chemistry: homogeneous catalysts	566
14.6	Compartments, catalysts and energy	568
14.6.1	Transfer of material	570
14.7	Organisation and control in chemical change	570
14.8	Genetic manipulation: a new industry?	572
14.9	The parallel and the orthogonal activities of man and biology	572
15	Element cycles and their evolution	577
15.1	Introduction	577
15.2	The nature of 'cycles'	580
15.3	The cycles of the rocks	581
15.4	The cycle of water	582
15.5	The cycle of air	583
15.6	The cycle of oxygen	584
15.7	The cycle of hydrogen	585
15.8	The cycle of carbon	585
15.9	The cycle of nitrogen	587
15.10	The cycles of sulphur and phosphorus	588
15.11	The cycles of light elements and metal ions	589
15.12	The cycling of other elements	590
15.13	The birth of cycles	592
15.14	Life and the cycles	593
15.15	Man's input to cycles	594
16	The evolving natural selection of the chemical elements and the senses	598
16.1	Introduction: summary of previous chapters	599
16.2	The bases of the initial chemical selection	601
16.2.1	Summary of variance at equilibrium	604
16.3	Co-operativity and selected phase formation on Earth	605
16.4	Steady states and their survival	608
16.5	Flow systems of many elements	611
16.6	Coded systems: DNA	612
16.7	Natural selection and element fitness	613
16.8	Optimal co-operativity in a steady state	614
16.9	Summary of survival values	615
16.10	Changes in components and evolution	616

16.11	Development rates and complexity	617
16.12	DNA, development and evolution	617
16.13	The environment and evolution	618
16.14	Assumptions underlying the steady state	619
16.14.1	Resources	620
16.14.2	General considerations concerning waste products	621
16.14.3	Selfish protection by individual species: population increase	626
16.15	The natural selection of the elements and the nature of man	627
16.15.1	Understanding	629
16.15.2	The senses	630
16.15.3	The brain	631
16.16	Future selection of the chemical elements	632
	Index	635
