Statistical Mechanics of Nonequilibrium Processes

Volume 1: Basic Concepts, Kinetic Theory

Akademie Verlag

Contents

1	Basic concepts of statistical mechanics	11
1.1	Classical distribution functions	11
1.1.1	Distribution functions in phase space	11
1.1.2	Liouville's theorem	15
1.1.3	Classical Liouville equation	17
1.1.4	Time reversal in classical statistical mechanics	20
1.2	Statistical operators for quantum systems	23
1.2.1	Pure quantum ensembles	24
1.2.2	Mixed quantum ensembles	27
1.2.3	Passage to the classical limit of the density matrix	29
1.2.4	Second quantization	34
1.2.5	Quantum Liouville equation	40
1.2.6	Time reversal in quantum statistical mechanics	43
1.3	Entropy	48
1.3.1	Gibbs entropy	48
1.3.2	The information entropy	54
1.3.3	Equilibrium statistical ensembles	57
1.3.4	Extremal property of the microcanonical ensemble	59
1.3.5	Extremal property of the canonical ensemble	63
1.3.6	Extremal property of the grand canonical ensemble	66
1.3.7	Entropy and thermodynamic relations	68
1.3.8	Nernst's theorem	72
1.3.9	Equilibrium fluctuations of thermodynamic quantities	76
1.3.10	Equilibrium fluctuations of dynamical variables	79
	Appendices to Chapter 1	84
1A	Time-ordered evolution operators	84
1B	The maximum entropy for quantum ensembles	86
	Problems to Chapter 1	87

2	Nonequilibrium statistical ensembles	89
2.1	Relevant statistical ensembles	90
2.1.1	Reduced description of nonequilibrium systems	90
2.1.2	Relevant statistical distributions	96
2.1.3	Entropy and thermodynamic relations in relevant ensembles	98
2.2	Examples of relevant distributions	100
2.2.1	Local equilibrium in classical fluids	100
2.2.2	Relevant distribution for classical gases	104
2.2.3	Relevant distribution for quantum gases	107
2.2.4	Diagonal relevant distribution for quantum systems	114
2.2.5	Relevant distribution for weakly interacting subsystems	115
2.3	The method of the nonequilibrium statistical operator	117
2.3.1	Retarded solutions of the Liouville equation	117
2.3.2	Generalized transport equations for observables	123
2.3.3	Entropy production in nonequilibrium states	127
2.3.4	Perturbation expansions of statistical distributions	129
2.3.5	Exponential form of the nonequilibrium distribution	132
2.3.6	Boundary conditions for the Liouville equation and the method of quasi-averages	136
2.4	Other approaches to the theory of nonequilibrium processes	142
2.4.1	Zwanzig's projection method	143
2.4.2	Robertson's projection method	146
2.4.3	The method of ergodic conditions	149
2.5	Simple examples of nonequilibrium processes	154
2.5.1	Relaxation of the momentum of foreign particles in a medium	154
2.5.2	The Pauli equation	160
2.5.3	Chemical reactions	164
	Appendices to Chapter 2	172
2A	Wick's theorem for nonequilibrium quantum gases	172
2B	Some useful operator identities	174
2C	Properties of the projection operators	176
2D	Boundary conditions in the quantum scattering theory	179
2E	Equivalence of nonequilibrium distributions	183
	Problems to Chapter 2	186
3	The classical kinetic theory	188
3.1	Cluster expansions in classical kinetic theory	189
3.1.1	The generalized kinetic equation	189
3.1.2	Reduced distribution functions	192
3.1.3	Hierarchy of equations for reduced distribution functions	193
3.1.4	The Boltzmann kinetic equation	194
3.1.5	Cluster expansion of the collision integral	201

3.2	Diagram methods in kinetic theory	209
3.2.1	The diagram technique	209
3.2.2	Diagram representation of correlation functions	217
3.2.3	Diagram representation of the collision integral	220
3.2.4	Simple examples	223
3.3	Kinetic theory of nonideal gases	227
3.3.1	Boltzmann collision integral for nonideal gases	227
3.3.2	Three-particle events	229
3.3.3	Many-particle events	232
3.3.4	The relevant distribution for dense gases	238
3.3.5	The Enskog kinetic equation	244
3.4	Kinetic equations for plasmas	248
3.4.1	The simplest kinetic equations: Vlasov and Landau	248
3.4.2	The binary correlation function for plasmas	256
3.4.3	The Balescu-Lenard collision integral	262
3.4.4	Generalized collision integrals	264
Appendices to Chapter 3		268
3A	Normal solutions of the Boltzmann equation	268
3B	Cluster expansions of distribution functions	276
3C	The three-particle resolvent	277
3D	Binary correlation functions for low-density gases	278
3E	Evaluation of binary correlation functions for plasmas	280
Problems to Chapter 3		281
4	The quantum kinetic theory	285
4.1	Quantum systems with weak interactions	286
4.1.1	The generalized quantum kinetic equations	286
4.1.2	The Markovian form of the collision term	290
4.1.3	The kinetic equation for the single-particle density matrix	291
4.1.4	The quantum Vlasov equation	294
4.1.5	The dielectric function for collisionless plasmas	297
4.1.6	The collision integral in the Born approximation	302
4.1.7	Electron-phonon interactions in metals	303
4.2	Cluster expansions in quantum kinetic theory	305
4.2.1	Quantum hierarchy for reduced density matrices	306
4.2.2	The quantum Boltzmann equation	309
4.2.3	Scattering of electrons by impurities in crystals	315
4.3	Kinetic theory of quantum systems beyond the Boltzmann equation	324
4.3.1	The approximation of binary correlations	325
4.3.2	The collision integral for quantum plasmas	328
4.3.3	Relevant statistical operators for dense quantum systems	331
4.3.4	The quantum Enskog equation	335

4.4	Quantum kinetic processes in strong external fields	341
4.4.1	The kinetic equation for weakly interacting systems in an alternating field	341
4.4.2	The gauge-invariant Wigner function	344
4.4.3	Kinetics of electrons in an electromagnetic field	347
4.4.4	The field corrections to electric conductivity	351
Appendices	to Chapter 4	354
4A	Rearrangement of the quantum collision integral	354
4B	Conductivity in the electron-impurity system	357
4C	The Markovian form of kinetic equations in an alternating field	362
Problems	to Chapter 4	363
