1 USEFUL CONCEPTS IN MOLECULAR MODELLING 1

- 1.1 Introduction 1
- 1.2 Coordinate systems 2
- 1.3 Potential energy surfaces 4
- 1.4 Molecular graphics 5
- 1.5 Surfaces 6
- 1.6 Computer hardware and software 7
- 1.7 Units of length and energy 9
- 1.8 The molecular modelling literature 9
- 1.9 The Internet 10
- 1.10 Mathematical concepts 10
- Appendix 1.1 A selection of websites 23
- Further reading 24
- References 24

2 QUANTUM MECHANICAL MODELS 25

- 2.1 Introduction 25
- 2.2 One-electron atoms 30
- 2.3 Polyelectronic atoms and molecules 34
- 2.4 Molecular orbital calculations 42
- 2.5 The Hartree–Fock equations 54
- 2.6 Basis sets 68
- 2.7 Open-shell systems 77
- 2.8 Electron correlation 80
- 2.9 Practical considerations when performing *ab initio* calculations 85
- 2.10 Approximate molecular orbital theories 89
- 2.11 Semi-empirical methods 90
- 2.12 Hückel theory 105
- 2.13 Valence bond theories 108
- 2.14 Calculating molecular properties using quantum mechanics 109
- 2.15 Performance of semi-empirical methods 123

2.16 Energy component analysis 123

Further reading 126

References 127

3 EMPIRICAL FORCE FIELD MODELS: MOLECULAR MECHANICS 131

3.1 Introduction 131

3.2 Some general features of molecular mechanics force fields 134

3.3 Bond stretching 137

3.4 Angle bending 140

3.5 Torsional terms 140

3.6 Improper torsions and out-of-plane bending motions 143

3.7 Cross terms and non-bonded interactions 145

3.8 Electrostatic interactions 148

3.9 van der Waals interactions 171

3.10 Many-body effects in empirical potentials 178

3.11 Effective pair potentials 180

3.12 Hydrogen bonding in molecular mechanics 181

3.13 Force field models for the simulation of liquid water 183

3.14 United atom force fields and reduced representations 188

3.15 Derivatives of the molecular mechanics energy function 193

3.16 Calculating thermodynamic properties using a force field 194

3.17 Force field parametrisation 196

3.18 Transferability of force field parameters 200

3.19 The treatment of delocalised π -systems 201

3.20 Force fields for metals and inorganic systems 202

Appendix 3.1 The interaction between two Drude molecules 205

Further reading 206

References 206

4 ENERGY MINIMISATION AND RELATED METHODS FOR EXPLORING THE ENERGY SURFACE 211

4.1 Introduction 211

4.2 Non-derivative minimisation methods 216

4.3 Introduction to derivative minimisation methods 219

4.4 First-order minimisation methods 220

4.5 Second derivative methods: the Newton–Raphson method 226

4.6 Quasi-Newton methods 228

4.7 Which minimisation method should I use? 229

4.8 Applications of energy minimisation 233

4.9 Determination of transition structures and reaction pathways 240

Further reading 258

References 259

5 COMPUTER SIMULATION METHODS 261

5.1 Introduction 261

5.2 Calculation of simple thermodynamic properties 266

- 5.3 Phase space 271
- 5.4 Practical aspects of computer simulation 274
- 5.5 Boundaries 276
- 5.6 Monitoring the equilibration 281
- 5.7 Truncating the potential and the minimum image convention 283
- 5.8 Long-range forces 294
- 5.9 The cell-multipole method for non-bonded interactions 301
- 5.10 Analysing the results of a simulation and estimating errors 302
- Appendix 5.1 Basic statistical mechanics 306
- Appendix 5.2 Heat capacity and energy fluctuations 308
- Appendix 5.3 The real gas contribution to the virial 309
- Appendix 5.4 Translating particle back into central box 310
- Further reading 311
- References 311

- 6 MOLECULAR DYNAMICS SIMULATION METHODS 313**
- 6.1 Introduction 313
- 6.2 Molecular dynamics using simple models 313
- 6.3 Molecular dynamics with continuous potentials 314
- 6.4 Setting up and running a molecular dynamics simulation 323
- 6.5 Constraint dynamics 327
- 6.6 Time-dependent properties 333
- 6.7 Molecular dynamics at constant temperature and pressure 342
- 6.8 Incorporating solvent effects into molecular dynamics: potentials of mean force and stochastic dynamics 347
- 6.9 Conformational changes from molecular dynamics simulations 352
- 6.10 Molecular dynamics simulations of chain amphiphiles 354
- Appendix 6.1 Energy conservation in molecular dynamics 363
- Appendix 6.2 Fourier series and Fourier analysis 364
- Further reading 367
- References 368

- 7 MONTE CARLO SIMULATION METHODS 371**
- 7.1 Introduction 371
- 7.2 Calculating properties by integration 373
- 7.3 Some theoretical background to the Metropolis method 376
- 7.4 Implementation of the Metropolis Monte Carlo method 378
- 7.5 Monte Carlo simulation of molecules 382
- 7.6 Models used in Monte Carlo simulations of polymers 386
- 7.7 'Biased' Monte Carlo methods 392
- 7.8 Monte Carlo sampling from different ensembles 394
- 7.9 Calculating the chemical potential 398
- 7.10 The configurational bias Monte Carlo method 399
- 7.11 Simulating phase equilibria by Gibbs Ensemble Monte Carlo method 405
- 7.12 Monte Carlo or molecular dynamics? 407

Appendix 7.1 The Marsaglia random number generator 408

Further reading 409

References 410

8 CONFORMATIONAL ANALYSIS 413

8.1 Introduction 413

8.2 Systematic methods for exploring conformational space 415

8.3 Model-building approaches 421

8.4 Random search methods 422

8.5 Genetic algorithms 424

8.6 Distance geometry 426

8.7 Exploring conformational space using simulation methods 434

8.8 Which conformational search method should I use? 442

8.9 Structural databases 443

8.10 Molecular fitting 445

8.11 Clustering algorithms and pattern recognition techniques 445

8.12 Reducing the dimensionality of a data set 451

8.13 The role of conformational analysis in predicting the structures of peptides and proteins 453

Further reading 475

9 THREE CHALLENGES IN MOLECULAR MODELLING: FREE ENERGIES, SOLVATION AND SIMULATING REACTIONS 481

9.1 The difficulty of calculating free energies by computer 481

9.2 The calculation of free energy differences 482

9.3 Applications of methods for calculating free energy differences 488

9.4 The calculation of enthalpy and entropy differences 493

9.5 Partitioning the free energy 493

9.6 Potential pitfalls with free energy calculations 495

9.7 Potentials of mean force 497

9.8 Continuum representations of the solvent 502

9.9 The electrostatic contribution to the free energy of solvation: the Born and Onsager models 503

9.10 Non-electrostatic contributions to the solvation free energy 518

9.11 Very simple solvation models 520

9.12 Modelling chemical reactions 520

9.13 Density functional theory 528

Appendix 9.1 Calculating free energy differences using thermodynamic integration 534

Appendix 9.2 Using the slow growth method for calculating free energy differences 535

Further reading 536

10 THE USE OF MOLECULAR MODELLING TO DISCOVER AND DESIGN NEW MOLECULES 543

- 10.1 Molecular modelling in drug discovery 543
 - 10.2 Deriving and using three-dimensional pharmacophores 544
 - 10.3 Molecular docking 554
 - 10.4 Structure-based methods to identify lead compounds 557
 - 10.5 *De novo* ligand design 560
 - 10.6 Molecular similarity 566
 - 10.7 Quantitative structure–activity relationships 569
- Further reading 582
- References 583
