Contents

	<i>Preface</i>	xi
	PART I SPECIAL RELATIVITY	
Chapter 1	Kinematics of a point mass	1
	1.1 The basis of Newtonian kinematics	1
	1.2 The basis of relativistic kinematics	3
	1.3 Minkowski space-time	5
	1.4 Four-vectors	9
Chapter 2	Changes of reference system	12
	2.1 Galilean transformations	12
	2.2 Poincaré transformations	16
	2.3 Change of basis of T_4 and addition of velocities	20
	2.4 Relativity principles	22
Chapter 3	Experiments	27
	3.1 The Michelson–Morley experiment	28
	3.2 Time	30
Chapter 4	Dynamics of a particle.	37
	4.1 The equation of motion	37
	4.2 Systems of particles	41
	4.3 Collisions	45
	4.4 Applications	49
Chapter 5	Mathematical framework	53
	5.1 Calculation rules for indices	53
	5.2 The dual space	55
	5.3 Change of basis	57
	5.4 Tensor product	59
	5.5 Classical fields	64

Chapter 6	The dynamics of continuous media	68
	6.1 Current density	68
	6.2 The electromagnetic field tensor	70
	6.3 Energy–momentum tensor	72
Chapter 7	General coordinate systems	78
	7.1 General coordinate systems and the natural associated basis	78
	7.2 Small variations and derivatives	84
	7.3 Dynamical equations	87
PART II RELATIVISTIC GRAVITATION		
Chapter 1	Newtonian gravitation	93
	1.1 The Newtonian equivalence principle	93
	1.2 Motion of two bodies	96
	1.3 Local equations for the gravitational field	99
Chapter 2	Metric theories of gravity	102
	2.1 Einstein's equivalence principle	103
	2.2 The idea of a metric	104
	2.3 Free fall of a test particle	105
	2.4 Metric theories	107
Chapter 3	Tests of metric theories in the Solar System	110
	3.1 Spherically symmetric, static space–times	110
	3.2 Motion of a test particle	113
	3.3 The Newtonian limit	114
	3.4 The post-Newtonian approximation	118
Chapter 4	Newtonian cosmology	127
	4.1 Distance measurements	127
	4.2 The Hubble effect	131
	4.3 Reinterpretation of the gravitational field equations	132
	4.4 Mass conservation and equations of motion	133
	4.5 Model of the expanding Universe	133
	4.6 Discussion of the Newtonian expansion model	135
	4.7 Evolution of the Universe	136
Chapter 5	Relativistic cosmology	139
	5.1 Discussion of the cosmological principle and the line element	139
	5.2 Redshifts	142
	5.3 Luminosity and redshift	143
Chapter 6	General relativity	148
	6.1 Elements of tensor calculus	148
	6.2 Parallel transport	152

	6.3	Isotropy in cosmology	153
	6.4	Einstein's equations	156
	6.5	Newtonian limit of general relativity	158
	6.6	Geodesics and equations of motion	159
Chapter 7		Applications of Einstein's equations	161
	7.1	Einstein's equations in cosmology	161
	7.2	The Schwarzschild solution	163
Chapter 8		General relativity in the weak field approximation	169
	8.1	Conventions and formulae	169
	8.2	Gauge invariance and the Einstein equations	170
	8.3	Solution of the linearised Einstein equations	172
	8.4	Changes of coordinates	177
	8.5	Interpretation of $h_{\alpha\beta}$	181
Chapter 9		Two experimental projects: a satellite gyroscope and a gravitational wave detector	184
	9.1	The gyroscope	184
	9.2	Gravitational waves	197
Appendix A		Lagrange's equations	208
	A.1	Formulation of the problem	208
	A.2	Lagrange's equations	209
	A.3	Motion of a free particle in special relativity	210
	A.4	Particular Lagrangians	211
	A.5	Change of parameter	212
	A.6	Free-fall motion of a test particle	213
Appendix B		Geometric framework of general relativity	216
	B.1	The notion of a fibre	216
	B.2	Linear connection	217
	B.3	Absolute differential and parallel transport	217
	B.4	Tangent space	219
	B.5	Connection associated with the tensor product of two spaces	220
	B.6	Change of frame	220
	B.7	Coordinate changes	221
	B.8	Metric connection theories without torsion	222
	B.9	The notion of curvature	225
	B.10	Locally Minkowski observers	228
	B.11	Special tensors and identities	229
		<i>Useful numerical values</i>	231
		<i>Bibliography</i>	234
		<i>Index</i>	237
