

Signal Processing in Electronic Communications

MICHAEL J. CHAPMAN

DAVID P. GOODALL

and NIGEL C. STEELE

School of Mathematics and Information Sciences

University of Coventry

**Horwood Publishing
Chichester**

Table of contents

Preface	v
1 Signals and linear system fundamentals	1
1.1 Introduction	1
1.2 Signals and systems	1
1.3 L-C-R circuits	4
1.4 Linear systems	9
1.5 Simulation diagrams	12
1.6 The Laplace transform	15
1.7 Introduction to generalized functions	16
1.7.1 The unit impulse function	17
1.7.2 Laplace transform of the impulse function	22
1.8 Some properties of the Laplace transform	22
1.9 Application to time-invariant linear systems	25
1.10 Transfer functions	30
1.11 Exercises	36
2 System responses	40
2.1 Introduction	40
2.2 Stability of linear time-invariant systems	40
2.3 The impulse response	44
2.4 The step response	48
2.5 Signal decomposition and convolution	50
2.6 Frequency response	58
2.7 Exercises	65
3 Fourier methods	67
3.1 Introduction	67
3.2 Fourier series	67
3.3 The Fourier transform	73
3.4 The Fourier spectrum	78
3.5 Properties of the Fourier transform	81
3.6 Signal energy and power	88
3.7 A generalization of the Fourier transform	91
3.8 The convolution theorems	96
3.9 Sampling of time signals and its implications	96

Table of contents

3.10 Exercises	101
4 Analogue filters	105
4.1 Introduction	105
4.2 Analogue filter types	105
4.3 A class of low-pass filters	108
4.4 Butterworth filters, the general case	113
4.5 Filter transformations	127
4.6 Other filter designs	134
4.7 Exercises	139
5 Discrete-time signals and systems	141
5.1 Introduction	141
5.2 Sequences	141
5.3 Linear systems	143
5.4 Simulation diagrams	146
5.5 The z -transform	148
5.6 Properties of the z -transform	150
5.7 Application to linear time-invariant systems	156
5.8 The z -transfer function	160
5.9 A connection with the Laplace transform	161
5.10 Exercises	162
6 Discrete-time system responses	164
6.1 Introduction	164
6.2 BIBO and marginal stability	164
6.3 The impulse response	166
6.4 The step response	167
6.5 Discrete-time convolution	169
6.6 The frequency response	172
6.7 Exercises	177
7 Discrete-time Fourier analysis	179
7.1 Introduction	179
7.2 The discrete Fourier transform, (DFT)	179
7.3 The discrete-time Fourier transform, DTFT	184
7.4 Estimating the DTFT	186
7.5 Estimating Fourier series	190
7.6 Estimating Fourier transforms	192
7.7 The fast Fourier transform	196
7.8 Exercises	203
8 The design of digital filters	206
8.1 Introduction	206
8.2 The impulse invariant method	206
8.2.1 Stability of the Impulse Invariant Method	208
8.2.2 Accuracy of the Impulse Invariant Method	208
8.3 The step invariant method	210

Table of contents

8.3.1	Stability of the Step Invariant Method	212
8.3.2	Accuracy of the Step Invariant Method	212
8.4	The Bilinear transform method	214
8.4.1	Stability of the Bilinear Transform Method	216
8.4.2	Accuracy of the Bilinear Transform Method	216
8.5	A 'direct' design method: the Fourier series approach	219
8.6	Windows	222
8.6.1	The rectangular window	222
8.6.2	Other popular windows	225
8.7	Exercises	227
9	Aspects of speech processing	231
9.1	Introduction	231
9.2	Speech production model	231
9.3	Correlation functions	233
9.3.1	The autocorrelation function	235
9.3.2	The cross-correlation function	237
9.3.3	An application of the autocorrelation function	237
9.4	Linear predictive filters	240
9.5	Estimation of the gain parameter	248
9.6	Formant estimation	249
9.7	Lattice filter formulation	251
9.8	The cepstrum	256
9.8.1	Stable sequences	257
9.8.2	Minimum-phase and maximum-phase sequences	257
9.9	Homomorphic systems and deconvolution	259
9.10	Cepstral analysis of speech signals	260
9.11	Formant estimation using cepstral analysis	264
9.12	Exercises	265
A	The complex exponential	268
A.1	Maclaurin series for exp, cos and sin	268
A.2	Properties of the complex exponential	269
A.3	The complex exponential form	272
B	Linear predictive coding algorithms	276
B.1	Durbin-Levinson algorithm	276
B.2	Cholesky decomposition algorithm	277
B.3	Burg algorithm	279
C	Answers to the exercises	281
	References	290
	Index	292
