

Hildegard Meyer-Ortmanns
Andreas Klümper (Eds.)

Field Theoretical Tools for Polymer and Particle Physics

Springer

Contents

Random Walks in Polymer Physics

Erich Eisenriegler	1
1 Introduction	1
2 Modelling a Polymer Chain in a Good Solvent and Relation to Field Theory	2
3 The Universal Scaling Behavior of a Long Polymer Chain	8
4 Polymers Interacting with Boundaries	11
5 Planar Boundary and Density–Force Relations	11
6 Spherical and Cylindrical Particles and Expansion for Small Radius	14
7 Summary	20
A Density–Force Amplitude in $d = 2$	20

Random Walks in Field Theory

Andreas Pordt	25
1 Introduction and Definition of a Random Walk Model	25
2 Classification of Random Walk Models	27
3 Euclidean Lattice Field Theory	29
4 Gaussian Model and Simple Random Walks	30
5 Random Walk Representation and Euclidean Field Theory	32
6 Symanzik’s Complete Polymer Representation	34
7 Inequalities	36
8 Triviality	38

Polymer Expansion in Particle Physics

Andreas Pordt	45
1 Introduction and Definitions	45
2 Examples	48
2.1 High Temperature Expansion, Ising Model	48
2.2 Low Temperature Expansion, Contour Expansion	49
2.3 N -Component Lattice Field Theory	50
2.4 Lattice Gauge Field Theory	52
2.5 Random Walks	54

2.6	Monomer-Dimer System, Polymer Systems	55
3	Exponential Function and Polymer Representation	55
4	Kirkwood-Salsburg and Mayer-Montroll Equations	57
5	Cluster Expansion Formula	58
6	Convergence Criteria	59
7	Polymer Expansions for Green Functions and Expectation Values	60
8	Thermodynamic Limit	64

Polymers, Spin Models and Field Theory

Bo Söderberg	68	
1	Introduction	68
2	Idealized Representations of Free Polymers	68
2.1	“Realistic” Model	68
2.2	Continuous Model	69
2.3	Lattice Model	70
3	Interacting Walks and Spin Models	70
3.1	Modified Walk Ensemble	70
3.2	Relation to a Spin Model	70
4	Interacting Continuous Polymers and Field Theories	71
4.1	Generic Interacting Polymer	71
4.2	The Relation to a Field Theory	72
4.3	Example 1: Contact Interaction	74
4.4	Example 2: The Polyelectrolyte	74
5	Relation in Terms of Perturbation Theory	75
6	Conclusions	77

Reaction-Diffusion Mechanisms and Quantum Spin Systems

Gunter M. Schütz	78	
1	Classical Stochastic Many-Body Dynamics in the Quantum Hamiltonian Formalism	78
1.1	The Master Equation	79
1.2	Many-Body Systems	83
1.3	Stationary States	85
2	Diffusion of Hard-Core Particles	85
3	Coarsening and Domain Growth	90
3.1	Glauber Dynamics for the Ising Model and the Voter Model	90
3.2	Order/Disorder Competition: A Simple Biological Model	92
3.3	Diffusion-Limited Annihilation Revisited	93
4	Experimental Realizations of Integrable Reaction-Diffusion Systems	95
4.1	Gel-Electrophoresis of DNA	95
4.2	Kinetics of Biopolymerization	97
4.3	Exciton Dynamics on Polymer Chains	99
5	Conclusions	100

Bosonization in Particle Physics

Dietmar Ebert	103
1 Introduction	103
2 NJL Model and σ Model	106
2.1 Linear σ Model	106
2.2 Nonlinear σ Model	110
3 Conclusions and Outlook	112

Hadronization in Particle Physics

Dietmar Ebert	115
1 Introduction	115
2 Hadronization of a Quark-Diquark Toy Model	115
3 Further Extensions	118
3.1 Heavy Baryons with Scalar and Axial-Vector Diquarks	118
3.2 Composite Diquarks	119

**The Hybrid Monte Carlo Algorithm
for Quantum Chromodynamics**

Thomas Lippert	122
1 Introduction	122
2 Elements of Lattice QCD	124
3 Hybrid Monte Carlo	126
3.1 $O(V)$ Algorithms for Full QCD	126
3.2 Hybrid Monte Carlo: Quenched Case	127
3.3 Including Dynamical (Wilson) Fermions	129
3.4 Numerical Integration and Improvements	130
4 Efficiency and Scaling	131

The Hybrid Monte Carlo Method for Polymer Chains

Anders Irbäck	133
1 Introduction	133
2 The Models	134
3 HMC	136
4 Fourier Acceleration	136
5 Numerical Tests	138

Simulations of Toy Proteins

Anders Irbäck	143
1 Introduction	143
2 The Models and the Algorithm	144
3 Good Folding Sequences	146
4 Nonrandom Hydrophobicity Patterns	148

5	Local Interactions	150
6	Summary	152

**Two Lectures on Phase Mixing:
Nucleation and Symmetry Restoration**

	Marcelo Gleiser	155
1	Homogeneous Nucleation	155
2	Nonperturbative Corrections to Decay Rates	158
	2.1 Modeling Nonperturbative Fluctuations: Symmetry Restoration and Phase Mixing	159
	2.2 Modeling Nonperturbative Fluctuations: “Inhomogeneous” Nucleation	164
3	Matching Numerical Simulations to Continuum Field Theories	166

Neural Networks and Confidence Limit Estimates

	Bernd A. Berg and Ion-Olimpiu Stamatescu	173
1	Views and Features of Neural Networks	173
2	The Modeling Problem for Neural Networks	175
	2.1 Architecture	176
	2.2 Functioning	177
	2.3 Learning	178
3	The Physics of Neural Networks	180
4	Multilayer Perceptrons and Data Analysis	183
5	From MLP Output to Confidence Limits	186
	5.1 Generalized Clopper–Pearson Approach	187
	5.2 Signal Probability Distributions	188
6	Conclusions	190

The Gross-Neveu Model and QCDs Chiral Phase Transition

	Thomas Reisz	192
1	Introduction - QCD and the Chiral Phase Transition	192
	1.1 Two-Flavour QCD	194
	1.2 Why Studying the Gross-Neveu Model?	196
2	The 3-Dimensional Gross-Neveu Model at Zero and Finite Temperature	197
	2.1 The Model	197
	2.2 Many Flavours. The Large N Expansion	201
	2.3 Phase Structure in the $N = \infty$ Limit	205
	2.4 What Happens for Finite N ?	207
3	Dimensional Reduction in Quantum Field Theory	208
	3.1 A Short Survey of Dimensional Reduction	209
	3.2 Application to the Three-Dimensional Gross-Neveu Model at Finite Temperature	214

4	Phase Transition for Finite Number of Flavours N	215
4.1	Convergent Series Expansion - LCE	218
4.2	The Nature of the Parity Transition	224
5	Summary	226

The TBA, the Gross-Neveu Model, and Polyacetylene

Alan Chodos and Hisakazu Minakata	231
---------------------------------------------	-----

Solitons in Polyacetylene

Siegmar Roth	240	
1	Introduction	240
2	Conjugated Polymers	242
3	Solitons and Conductivity	243
4	Solitons: Optical Fingerprints	247
5	Metal-Insulator Transition	248
6	Particles and Antiparticles, Spin-Charge Inversion, Fractional Charges	250
7	Polarons, Confinement	252
8	Technical Applications of Conducting Polymers	256
