

Stanislav V. Emelyanov and Sergey K. Korovin

Control of Complex and Uncertain Systems

New Types of Feedback

With 336 Figures

Springer

Table of Contents

Introduction	1
Part I. Principles Underlying the Design of Automatic Control Systems	5
1. Principles Underlying the Design of Linear Automatic Control Systems	9
1.1. Statement of a Control Problem and Preliminaries	9
1.2. Load Control Principle	20
1.3. Principle of Disturbance Control	23
1.4. Compensation Principle in an Indirect Measurement of Disturbance	26
1.5. Double-Channel Principle	31
1.6. The K -Image Method or the Method of an Internal Model	39
1.7. High Gain Factor	45
1.7.1. Statement of the problem, its peculiarities and the idea of its solution	45
1.7.2. Problems and limitations of the high gain feedback method	47
1.7.3. On the robustness of systems with a high gain factor	51
1.7.4. The state space method in the analysis of systems with a high gain factor	53
1.7.5. Geometrical interpretation of systems with a high gain factor	54
1.7.6. The effect produced by an amplitude constraint on systems with a high gain factor	55
1.8. Bibliographical Comments	56
2. Synthesis of Nonlinear Controllers	59
2.1. Relay Feedback	59
2.1.1. Basic concepts	59
2.1.2. Sliding mode at a point	62
2.1.3. Switching mode	64
2.1.4. On the robustness of the switching mode	66
2.1.5. Relay stabilization of an object with self-regulation	67
2.1.6. Stabilization of an object with a high relative order	68

2.1.7.	Robust stabilization: discontinuity, continuity, and information about the state	69
2.1.8.	Robust stabilization of an object of the first relative order	70
2.1.9.	Sliding mode on an interval	71
2.1.10.	Real sliding mode on an interval	72
2.1.11.	Relay stabilization of a generalized object	73
2.2.	Stabilization of an Object with an Uncertain Operator	74
2.2.1.	Generalities	74
2.2.2.	Principle of cascade control	78
2.2.3.	The structure of objects with cascade control	82
2.2.4.	Stabilization of interval objects	83
2.2.5.	Interval stability	85
2.2.6.	General features of the adaptive stabilization theory	89
2.3.	Stabilization by a Variable Structure Controller	97
2.3.1.	An astatic tracking system	97
2.3.2.	Second-order astatism	103
2.3.3.	Astatism of order m	103
2.3.4.	A variable structure astatic tracking system	104
2.3.5.	Sliding mode throughout a straight line	108
2.3.6.	Analysis of robustness of VSS relative to parametric perturbations	110
2.3.7.	VSS in the presence of an external force	113
2.3.8.	Quasirelay representation of a ψ -cell	115
2.3.9.	Limitations and drawbacks of the VSS theory and the related problems	118
2.4.	Bibliographical Comments	118

Part II. New Types of Feedback

121

3.	General Aspects of the Theory of New Types of Feedback	125
3.1.	Introductory Remarks	125
3.2.	System of Basic Concepts	127
3.2.1.	Operator signal	127
3.2.2.	Types of dynamical objects	128
3.2.3.	Binary operation	129
3.2.4.	Types of control elements	130
3.2.5.	New types of feedback	130
3.3.	Structural Synthesis of Binary Systems	131
3.3.1.	Stabilization problem	131
3.3.2.	Nonlinear feedback as a means of suppressing uncertainty	138
3.3.3.	Filtration problem	140
4.	Theory of Coordinate-Operator Feedback	145
4.1.	Stabilization of a Second-Order Object with Unknown Parameters and an External Action	146
4.1.1.	The scalarization principle and the equation of an object in the error space	147

4.1.2.	Some remarks concerning the statement of the problem and its generalizations	148
4.1.3.	The coordinate-operator phase space	152
4.2.	CO-Algorithms of Stabilization	155
4.2.1.	Direct compensation	156
4.2.2.	Asymptotic estimation or an indirect measurement of the O-perturbation	156
4.2.3.	Compensation for a wave O-perturbation	157
4.2.4.	Relay CO-stabilization	158
4.2.5.	Remark concerning the robustness of systems with relay CO-feedback	162
4.2.6.	Linear CO-algorithms of stabilization	163
4.2.7.	Integro-relay CO-algorithm of stabilization	166
5.	Higher-Degree Sliding Modes	169
5.1.	Preliminaries from the Theory of Sliding Modes	169
5.1.1.	Equations of sliding	170
5.1.2.	On the invariance of an equation of sliding relative to disturbances which satisfy the matching condition	172
5.1.3.	Equations of real sliding	173
5.1.4.	Remarks concerning the degree of sliding	177
5.2.	Algorithms of Second-Degree Sliding	181
5.2.1.	Asymptotic algorithms of the second-degree sliding	183
5.2.2.	Discontinuous asymptotic algorithms for the second-degree sliding	185
5.2.3.	Finite algorithms of second-degree sliding: linear feedback	187
5.2.4.	Finite algorithms of second-degree sliding: relay feedback	188
5.2.5.	Twisting algorithm	189
5.3.	Output Finite Stabilization	191
6.	Theory of Operator Feedback	195
6.1.	The Purpose of Operator Feedback	195
6.2.	Motion Equations in the Coordinate-Operator Space	198
6.3.	Statical Operator Feedback	200
6.3.1.	Statical operator and coordinate-operator feedbacks	200
6.3.2.	Statical operator and dynamical coordinate-operator feedbacks	203
6.3.3.	Inertial coordinate-operator feedback	203
6.3.4.	Inertial-relay coordinate-operator feedback	206
6.3.5.	Inertial-relay coordinate-operator feedback with an unknown parameter in the control	209
6.3.6.	Integral-relay coordinate-operator feedback	210

7. Theory of Operator-Coordinate Feedback	213
7.1. Dynamical Statism and Operator-Coordinate Feedback	213
7.2. Motion Equations for an Operator-Coordinate Object	216
7.3. Statical OC-Controller	218
7.4. Integral OC-Controller	219
7.5. The Main Properties and Specific Features of Binary Stabilization Systems with Different Types of Feedback	223
7.6. Discontinuous OC-Feedback	225
7.6.1. Integral-relay OC-controller	225
7.6.2. Second-degree sliding modes in an OC-loop	228
8. Constraints, Physical Foundations of the Compensation for Dis- turbances, and Stabilization of Forced Motion in Binary Sys- tems	235
8.1. Constraints Imposed on the Operator Variable	236
8.2. On the Global Behavior of a Binary System	241
8.3. Physical Foundations of the Compensation for Uncertainty	244
8.4. On the Compensation for the Coordinate Disturbance	245
9. Signal Differentiation	251
9.1. Statement of the Differentiation Problem	251
9.1.1. Filtration	253
9.1.2. <i>RC</i> -circuit	254
9.1.3. Discrete-difference approximations	257
9.2. Tracking Differentiating Systems	260
9.2.1. A linear differentiator	260
9.2.2. Relay differentiator	264
9.2.3. Variable-structure differentiator	268
9.3. Tracking Asymptotic Binary Differentiator	270
9.4. Finite Binary Differentiator	274
9.5. Nonstandard Differentiating Systems	276
9.5.1. Differentiator with a "small" amplitude of discontinuities	277
9.5.2. Nonstandard binary differentiator	279
9.5.3. The results of discrete simulation of a nonstandard binary differentiator	284
10. Suboptimal Stabilization of an Uncertain Object	287
10.1. Statement of the Optimal Stabilization Problem	287
10.2. Example of an Optimal Stabilization Problem under Uncertainty	289
10.3. Optimal Stabilization "in the Mean"	290
10.4. Minimax Optimal Stabilization	291
10.5. Stabilization with the Use of the Standard Model and an Er- ror Feedback with High Gain	292

10.6. Stabilization by the Methods of the Binary Control Theory . . .	295
10.6.1. A variable structure system	296
10.6.2. Binary stabilization with an integral CO-feedback	297
10.6.3. Stabilization with the use of a second-degree sliding mode	298
10.7. Reduction of the Suboptimal Stabilization Problem to the Prob-	
lem of Asymptotic Invariance	299
10.7.1. Main concepts of the theory of asymptotic invariance . . .	299
10.7.2. Suboptimal linearly quadratic stabilization	301
Conclusion	305
Bibliography	309
Index	317
