Thin-film microoptics - New frontiers of spatio-temporal beam shaping

TABLE OF CONTENTS

PREFACE	vii
ACKNOWLEDGEMENTS	ix
LIST OF ABBREVIATIONS	xvii
1. INTRODUCTION	1
2. MICRO-OPTICS	3
2.1. The concept of microoptics	3
2.2. Microoptics and macrooptics	6
2.2.1. Scaling laws for a size reduction	6
2.2.2. Diffraction and Fresnel number	7
2.3. Types of microoptical components	9
2.4. Refractive microoptics	11
2.4.1. Specific properties of refractive microoptical components	11
2.4.2. Gradient index lenses	12
2.4.3. Spherical surface relief lenses	13
2.4.4. Fresnel lenses	17
2.4.5. Fabrication of refractive components	18
2.5. Reflective microoptics	19
2.6. Diffractive microoptics	21
2.7. Hybrid microoptics	23
2.8. Replication and structure transfer	25
2.9. Specific properties of array structures	26
2.9.1. Types and general features of microoptical array structures	26
2.9.2. Fill factor, efficiency and symmetry	27
2.9.3. Spatial frequencies and Fresnel numbers	29
2.9.4. Cross-talk and self-imaging effects	30
2.9.5. Wavefront detection with array components	32
2.9.6. Gabor superlens	34
2.10. Stacked and planar microoptics	35
2.11. Problems and trends	35

3. THIN-FILM OPTICS	39
3.1. The concept of thin-film optics	39
3.2. Single transparent layer on substrates	39
3.2.1. Uniform Fabry-Pérot etalon at monochromatic illumination	40
3.2.2. Fabry-Pérot etalon of space-variant thickness at monochromatic illumination	44
3.2.3. Fabry-Pérot etalon of space-variant thickness at polychromatic illumination	45
3.2.4. Transmission of ultrashort pulses through plane-parallel etalon structures	47
3.2.5. Quarter-wave layers and half-wave layers at monochromatic illumination	48
3.2.6. Admittance of absorbing layers at optical frequencies	49
3.3. Dielectric multilayer structures	51
3.3.1. The multilayer approach	51
3.3.2. Method of characteristic matrices	51
3.3.3. Dispersion management by layer stacks of adapted spectral phases	53
3.3.4. Diffraction management by layer stacks of spatially variable reflectance	54
3.4. Metal and metal-dielectric coatings	56
3.4.1. Single reflecting metal layers	56
3.4.2. Metal-dielectric layers as Gires-Tournois interferometer structures	56
3.5. Problems and trends	57
4. THIN-FILM MICROOPTICS	59
4.1. The concept of thin-film microoptics	59
4.2. Techniques for the fabrication of structured thin films: from macroscopic to microscopic scale	60
4.2.1. Subtractive and modifying techniques	60
4.2.2. Uniformity and nonuniformity of deposited layers	61
4.2.3. Separately rotating masks for structured light exposure and vapor deposition	62
4.2.4. Fixed thick shadow masks and extended sputtering sources	63
4.2.5. Fixed thin circular shadow masks rotating with the substrate	64
4.2.6. Thick shadow masks fixed at the substrates in a rotating system with point source	64
4.2.7. Deposition of arrays of microoptical components with miniaturized shadow masks	65
4.2.8. Simulation of the deposition through thick shadow masks fixed on a substrate in a system with planetary rotation	67

4.3. Specific properties of thin-film microoptical components	71
4.3.1. Specific advantages of thin-film deposition technique with shadow masks	71
4.3.2. Specific advantages of thin-film microoptical design	71
4.3.3. Thin-film microoptics on substrates: Specific properties and design constraints	73
4.3.4. Contact angle and maximum angle of incidence of thin-film microlenses	78
4.4. Types of thin-film microoptical components	78
4.5. Fabrication of thin-film microoptics with shadow masks	80
4.5.1. Vacuum deposition with planetary rotation and shadow masks	80
4.5.2. Types of shadow masks for the deposition of thin-film microstructures	81
4.5.3. Generation of arrays of high fill factors with the method of crossed deposition	83
4.5.4. Wire-grid masks	85
4.5.5. Deposition of nonspherical elements with slit and hole array masks of conical apertures	88
4.5.6. Generation of arrays of high fill factors and parabolic profiles with mesh-shaped masks	93
4.6. Pre-processing of polymer substrates for improving the adhesion of thin-film microoptics	95
4.7. Multilayer and compound microoptics	98
4.7.1. Multilayer microoptics	98
4.7.2. Metal-dielectric structures	99
4.8. Structure transfer of thin-film microoptical components by reactive ion etching	103
4.9. Nanolayer microoptics	105
4.10. VUV-capable transparent thin-film microoptics	107
4.11. Problems and trends	109
5. CHARACTERIZATION OF THIN-FILM MICROOPTICS	111
5.1. Specific measuring problems	111
5.2. Interferometric characterization of thin-film microlens arrays	112
5.2.1. Phase shift interferometer	112
5.2.2. Characterization of shape distribution and periodicity of microlens arrays	113
5.2.3. Optical functions of thin-film microlens arrays	116
5.3. Reflectance mapping of multilayer microoptics	119
5.3.1. Spatially resolved measurement of specular reflectance	119
5.3.2. Spatial reflectance mapping with angular resolution	123
5.4. Near field propagation measurements	123

6. SPATIAL BEAM SHAPING WITH THIN-FILM MICROOPTICS	125
6.1. Hybrid microoptics for improved efficiency of laser diode collimation	125
6.1.1. Motivation and basic concepts	125
6.1.2. Slow-axis collimation with compact systems of cylindrical microlenses	128
6.1.3. Angular-adapted micro-gradient AR coatings	130
6.2. Mode-selection in laser resonators	133
6.2.1. Stability management of compact solid-state laser resonators with micro-mirrors	133
6.2.2. Talbot resonators with micro-mirror arrays	134
6.2.3. Mode stabilization in laser diode MOPA-systems with external resonator for second harmonic generation	137
6.3. Generation of Bessel-like nondiffracting beams	139
6.3.1. Nondiffracting beams	139
6.3.2. Bessel-like beams	141
6.3.3. Generation of arrays of microscopic Bessel-like beams with thin-film axicons	143
6.3.4. Spatial self-reconstruction of Bessel-like beams	146
6.3.5. Self-apodized truncation of Bessel beams as a first way to shape needle beams	147
6.3.6. Ultraflat thin-film axicons of extremely small conical angles as a second way to generate needle beams	152
6.4. Shack-Hartmann wavefront sensing at extreme laser parameters with Bessel-like beams	155
6.4.1. Particular features of Shack-Hartmann sensors with Bessel-like nondiffracting beams	155
6.4.2. Transmissive and reflective setups with angular-tolerant thin-film microaxicons	157
6.5. VUV laser beam array generation and multichannel materials processing	160
6.5.1. VUV beam array generation with thin-film microoptics	160
6.5.2. Beam cleaning by absorption	162
6.5.3. VUV materials processing with thin-film microoptics	163
7 SPATIO-TEMPORAL BEAM SHAPING AND CHARACTERIZATION OF ULTRASHORT-PULSE LASERS	167
7.1. Motivation	167
7.2. Coherence mapping	168
7.2.1. Microoptical approaches based on multichannel interferometry	168
7.2.2. Coherence mapping with thin-film Fabry-Pérot arrays	171
7.2.3. Coherence mapping with arrays of Bessel-like beams	172

7.2.4. Decoding of axial coherence information with arrays of Bessel-like beams	176
7.2.5. Coherence mapping with the Talbot effect	176
7.3. Spatio-temporal autocorrelation	179
7.3.1. Processing and characterization of ultrashort optical pulses	179
7.3.2. Concept of the collinear matrix autocorrelator based on arrays of Bessel-like beams	180
7.3.3. Transversal autocorrelation information in Bessel-like beams	182
7.3.4. Wavefront autocorrelation experiments	183
7.4. Hyperspectral sensing of polychromatic wavefronts	188
7.4.1. Prospects for a spatially-resolved spectral phase measurement	188
7.4.2. Hyperspectral Shack-Hartmann wavefront sensor with graxicon arrays	190
7.5. Generation of optical spatio-temporal X-pulses with thin-film structures	193
7.5.1. X-waves and X-pulses as spectral interference phenomena in spatio-temporal domain	193
7.5.2. Generation and direct detection of arrayed microscopic-size pulsed optical Bessel-like X-waves and single macroscopic Bessel-Gauss X-pulses	194
7.6. Self-apodized truncation of ultrashort and ultrabroadband Bessel pulses	196
7.6.1. Spatial propagation of ultrashort-pulsed and ultrabroadband truncated Bessel-like beams generated with thin-film beam shapers	197
7.6.2. Spatio-spectral and spatio-temporal transfer of ultrashort-pulsed and ultrabroadband truncated Bessel-Gauss beams	199
7.6.3. Comparison to ultrashort-pulsed Gaussian beams	201
7.7. Spatio-temporal self-reconstruction and nondiffracting images	202
7.7.1. Self-reconstruction and spatio-temporal information	202
7.7.2. Nondiffracting images	203
