Preface, V
Part I. Analytical Mechanics (*Roman Gutowski*), 1

Chapter 1. Constrained mechanical systems, 3

1.1 Constrained and free mechanical systems, 3
1.2 Holonomic, non-holonomic, scleronomous, and rheonomous constraints, 4
1.3 Extending the concept of constraints. Constraints in controlled mechanical systems, 9

Chapter 2. Variational principles of mechanics, 13

2.1 Virtual displacements, 13
2.2 Ideal constraints, 15
2.3 D'Alembert's principle, Jourdain's principle, and Gauss's principle, 17
2.4 The principle of virtual work and the foundations of analytical statics, 26
2.5 Construction of equations of motion of mechanical systems based on differential variational principles, 30
2.6 Generalized coordinates and velocities and quasi-coordinates and quasi-velocities, 33
2.7 Hamilton's principle, 42
2.8 Asynchronous variation. The Maupertuis–Lagrange principle, 44

Chapter 3. Equations of motion of mechanical systems in Lagrange variables and quasi-coordinates, 49

3.1 Lagrange equations of the second kind for holonomic systems, 49
3.2 The energy of a system in generalized coordinates, 54
3.3 Lagrange's equations of the second kind in the form of ordinary differential equations. Invariance of Lagrange's equations of the second kind, 66
3.4 Boltzmann–Hamel equations for holonomic systems in quasi-coordinates, 71

3.5 Equations of motion for non-holonomic systems in generalized coordinates and quasi-coordinates, 75

Chapter 4. Equations of motion of material systems in canonical variables, 82

4.1 Canonical variables. Hamilton's function, 82
4.2 Equations of motion of holonomic systems in canonical variables, 85
4.3 Equations of motion of non-holonomic systems in canonical variables, 89
4.4 The Hamilton–Jacobi method of investigating the motion of material systems, and its connection with the canonical equations of motion, 91

Chapter 5. Canonical transformations, 99

5.1 Finite and infinitely small canonical transformations, 99
5.2 The connection between canonical transformations and the Hamilton–Jacobi theory, 104

Chapter 6. Integral invariants and conservation laws, 108

6.1 Systems of differential equations of motion which have integral invariants, 108
6.2 The relationship between integral invariants and canonical transformations, 112
6.3 Phase fluid and the hydrodynamic interpretation of integral invariants, 113
6.4 Conservation laws in classical mechanics. The Noether theorem, 116

Bibliography, 119

Part II. Relativistic Mechanics (*Stanisław Leon Bażański*), 121

Chapter 1. Physical origin of the special theory of relativity, 123

1.1 Development of early ideas about time and space, 123
1.2 The Michelson–Morley experiment, 125
1.3 Aberration, 127
1.4 Fizeau's experiment, 127
1.5 Precursors of new views on time and space, 130
1.6 The approach proposed by Einstein, 131

Chapter 2. Galilean space-time, 133
2.1 Fundamental assumptions, 133
2.2 The structure of space–time, 134
2.3 Galilean transformations, 136
2.4 The description of motion and the ether in Galilean space–time, 137

Chapter 3. Basic space–time concepts of the special theory of relativity, 139
3.1 Postulates, 139
3.2 The physical construction of the basic space–time concepts, 139
3.2.1 Local time of inertial observers, 140
3.2.2 The relativity of simultaneity and dilation of time, 148
3.2.3 The clock paradox, 151
3.3 The composition of velocities, 152
3.4 The Lorentz transformations, 156
3.5 Length contraction, 157

Chapter 4. Minkowski space–time, 160
4.1 The structure of Minkowski space–time, 160
4.2 Isometries of the Minkowski vector space, 162
4.3 The Poincaré transformations, 170
4.4 Minkowski space as a model of space–time, 172
4.5 The Minkowski diagram, 173
4.5.1 The interpretation of Lorentz boosts, 175
4.5.2 The interpretation of various kinematic facts, 178
4.6 Invariant space–time submanifolds, 180

Chapter 5. Relativistic kinematics, 182
5.1 The proper time of an arbitrary observer, 182
5.2 The description of motion of a point particle, 185
5.2.1 Velocity, 186
5.2.2 Acceleration, 188
5.3 Description of motion in an instantaneous rest tetrad, 192

Chapter 6. Dynamics of a material point, 195
6.1 Postulates, 195
6.2 Dynamics of a point particle, 197
6.2.1 A free particle, 197

6.2.2 An interacting particle, 198
6.2.3 Lagrange equations of relativistic dynamics, 201
6.3 Examples, 202

Chapter 7. Conservation principles, 206

7.1 The Noether theorem for the dynamics of point particles, 206
7.2 The Noether equation for relativistic dynamics, 213
7.3 Dynamic symmetries corresponding to Poincaré transformations, 214
7.4 Angular momentum and the centre of mass of a system of free particles, 218
7.5 An application of the second Noether theorem, 223

Chapter 8. Equations of motion, 225

8.1 The second principle of dynamics, 225
8.2 Equations of motion in an instantaneous rest tetrad, 227
8.3 The motion of a particle with internal angular momentum, 229

Chapter 9. Canonical formalism, 233

9.1 Two formulations of the problem, 233
9.2 The fundamental lemma, 234
9.3 Inhomogeneous formalism with coordinate time, 235
9.4 Difficulties of the homogeneous formalism, 237
9.5 Generalization of the fundamental lemma, 240
9.6 Homogeneous formalism with proper time, 242
9.7 The equivalence of both formalisms, 244
9.8 Examples, 245
9.9 The Hamilton–Jacobi equation, 247

Chapter 10. Comments on the relativistic many-body problem, 252

10.1 Relativistic mechanics and field theory, 252
10.2 The no-interaction theorems, 254
10.3 The dynamics of a system of many point particles, 256

Bibliography, 263

Part III. Quantum Mechanics (*Jan Sławianowski*), 265

Introduction, 267

Chapter 1. Basic concepts of quantum mechanics. Historical origins, 270

1.1 Principles of analytical mechanics, 270
1.2 The Hamilton–Jacobi theory, 282
1.3 Bohr–Sommerfeld conditions and the heuristics of quantization, 291

Chapter 2. Quantum mechanics of a material point. Wave mechanics, 301

2.1 Fundamental postulates of wave mechanics. Physical interpretation of the formalism, 301
2.2 Quantization of material point mechanics. Position, momentum, and angular momentum, 318
2.3 Dynamics, Schrödinger's equation, and the structure of the spectrum, 335

Chapter 3. General formulation of quantum mechanics and examples, 353

3.1 Hilbert space formalism, 353
3.2 Description of spin. Wave mechanics of particles with spin, 359
3.3 The many-body problem, identical particles, 364
3.4 Quantization in curvilinear coordinates, 367

Chapter 4. Simple applications of quantum mechanics, 369

4.1 The meaning of exact solutions, 369
4.2 The one-dimensional harmonic oscillator, 369
4.3 The smooth potential well, 372
4.4 The two-body problem, motion in a central field, 374
4.5 The hydrogen-like atom, 380

Chapter 5. Some approximate methods and their applications, 384

5.1 Time-independent perturbation theory. The helium atom, 384
5.2 Time-dependent perturbation theory. Interaction of atoms with an electromagnetic field, 389
5.3 The Born–Oppenheimer method, 397
5.4 The quasi-classical WKB method, 399

Bibliography, 403

Part IV. Mechanics of Continuous Media (*Czesław Woźniak*), 405

Introduction, 407

Chapter 1. Basic concepts, 409

1.1 Bodies and motions, 409
1.2 Mass, 413
1.3 Forces, 413
1.4 Heat supply, 414
1.5 Temperature, internal energy, and specific entropy, 415

Chapter 2. Fundamental principles, 417

2.1 Mass conservation principle, 417
2.2 Principle of balance of momentum, 417
2.3 Principle of balance of angular momentum, 418
2.4 Principle of balance of energy, 419
2.5 Dissipation principle, 419

Chapter 3. Investigation of the balance principles, 421

3.1 General balance principle, 421
3.2 Flux field, 422
3.3 Spatial forms of the balance principle, 423
3.4 Referential forms of the balance principle, 424
3.5 Conditions on singular surfaces, 424

Chapter 4. General field equations, 427

4.1 Continuity equation, 427
4.2 Equations of motion: spatial description, 428
4.3 Equations of motion: referential description, 430
4.4 Energy equation, 431
4.5 Local dissipation inequality, 433
4.6 Strain and strain rate relations, 434

Chapter 5. Materials, 437

5.1 Basic ideas, 437
5.2 The concept of history, 440
5.3 Time-local properties and internal variables, 441
5.4 Simple materials. Thermoelastic materials, 443
5.5 Differential-type materials. Viscoelastic materials, 444
5.6 Elastic/viscoplastic materials, 445
5.7 Newtonian fluids, 447

Chapter 6. Constraints and loadings, 451

6.1 Basic ideas, 451
6.2 Constraint responses, 454
6.3 Some special constraints, 458
6.4 Local boundary interactions, 460
6.5 Constitutive internal constraints, 461

Chapter 7. Specialized theories, 466

7.1 Theory of finite thermoelastic deformations, 466
7.2 Linearized theories in solid mechanics, 469
7.3 Theory of Newtonian fluids, 473
7.4 Structural mechanics theories, 476

Final remarks, 482

Bibliography, 483

Part V. Phenomenological thermodynamics (*Krzysztof Wilmański*), 485

Chapter 1. Introduction, 487

Chapter 2. Fundamentals of abstract phenomenological thermodynamics, 492

2.1 Preliminary discussion, 492
2.2 Neoclassical thermodynamics of an isolated system, 496
2.3 Neoclassical thermodynamics of thermodynamic subsystems, 505
2.4 The scalar balance equation, 509
2.5 Final remarks, 515

Chapter 3. Thermodynamics of thermomechanical materials, 517

3.1 The balance equations in the local theory of continuous media, 517
3.2 The Clausius–Duhem inequality, 525
3.3 The thermodynamics of a rigid heat conductor, 531
3.4 The I-Shih Liu method—the Lagrange multipliers, 537
3.5 The influence of body forces and radiation, 549
3.6 General theory of materials, 551
3.7 Examples, 554
3.7.1 The continuity of enthalpy in the classical theory of phase transitions, 555

3.7.2 The constitutive relation for a real gas and the phase transition in it, 557

Chapter 4. Comments on the second law of thermodynamics, 561

4.1 Introduction, 561
4.2 The second law of thermodynamics in Carathéodory's formulation, 562
4.3 The identities of classical thermostatics. Thermodynamic potentials, 572
4.4 Cyclic processes and heat-engine efficiency, 575
4.5 The second law of thermodynamics in Day's formulation, 585

Bibliography 588

Index 590
